Theory Extraction Report

Automated identification of theoretical frameworks in sports science research

PUBLISHED
March 24, 2026

Overview

This report documents the automated extraction of theoretical frameworks from a sample of applied sports science research articles. Extraction was performed using a locally hosted large language model (LLM) accessed via Ollama, with all model parameters fixed to ensure deterministic and reproducible outputs. The pipeline identifies both explicitly named theories and implicitly inferred conceptual frameworks, assesses how well stated hypotheses are grounded in theory, and evaluates the extent to which authors re-engage with their theoretical framework in the discussion section.

Model: qwen2.5:7b | **Temperature:** 0 | **Seed:** 42 | **Prompt version:** 4.0.0

Section 1: Processing Summary

Methods. PDF articles were converted to structured XML using GROBID (Generic Recognition of Documents), a machine learning library that segments academic papers into labelled sections (introduction, methods, results, discussion, etc.). Each section was then extracted and passed to the LLM for analysis. This section reports the success and quality of the PDF parsing and text extraction steps before any LLM analysis took place.

How to read this section. The table below shows counts at each processing stage. Highlighted rows indicate potential data quality issues that may affect downstream analyses. Articles with very short introductions may not have been parsed correctly by GROBID and should be manually verified.

Processing pipeline counts

Stage	Count
PDFs found in Study_papers/	269

XML files created by GROBID	269
Articles with introduction text successfully extracted	269
Articles with very short introductions (< 200 characters) — possible parsing error	0
LLM theory extraction successes	269
LLM theory extraction failures	0
Articles where no theory was detected by the model	94

Introduction length — character counts across all articles

Minimum (chars)	Median	Mean	Maximum
579	4690	5243	15915

Section 2: Theory Extraction Overview

Methods. The introduction section of each article was passed to the LLM with a structured prompt instructing it to identify theoretical frameworks. The model was asked to distinguish between two types of theory and two functional roles:

- **Explicit theory:** A named theoretical framework directly cited in the text (e.g., "Self-Determination Theory", "Central Governor Model").
- **Implicit theory:** A conceptual or mechanistic framework that is not formally named but is clearly present in the language and reasoning of the introduction (e.g., describing arousal-performance curves without naming the Inverted-U Hypothesis).
- **Operational theory:** The theory directly generates a specific, falsifiable prediction that is actually tested in this study. The hypothesis follows logically from the theory — the theory is doing scientific work.
- **Contextual theory:** The theory is cited as background, motivation, or general framing but does not generate the specific hypothesis being tested. The theory is present in the introduction but is not operationalised into a testable prediction.

How to read this section. The summary table reports counts of theories at different levels. The distinction between operational and contextual theories is particularly important: a high proportion of contextual theories suggests that researchers are citing theoretical frameworks for rhetorical purposes without using them to derive their hypotheses. **Confidence** reflects the model's self-assessed certainty (0–1) that the identified framework qualifies as a theory under the definition in the prompt.

Theory extraction summary

Metric	Value
Total theory instances extracted across all articles	421.00
Explicit theories (theory named directly in text)	393.00
Implicit theories (framework inferred from conceptual language)	28.00
Articles containing at least one theory	190.00
Articles where no theory was detected	94.00
Mean number of theories per article (all articles)	1.57
Mean number of theories per article (articles with at least one theory)	2.22
Operational theories — drive a specific testable prediction in this study	37.00
Contextual theories — cited as background or framing only, not operationalised	384.00

Theoretical basis quality rating per article — assigned by the LLM based on whether any identified theory generates a testable prediction

Theoretical basis quality	Count	%	What this means
absent	93	35%	No theoretical framework identified
strong	22	8%	At least one theory generates a clear, testable prediction
weak	154	57%	Theories are cited but none clearly drives a specific prediction

Model confidence scores by theory type. Confidence reflects the model's self-assessed certainty (0 = none, 1 = certain) that the identified framework meets the definition of theory used in the prompt.

Theory type	Mean confidence	Median	Min	Max
explicit	0.77	0.85	0.30	1.00
implicit	0.66	0.65	0.55	0.75

2b: Theory Framework Type

What this means. Not all frameworks called "theories" function equivalently from an epistemological standpoint. This classification distinguishes between four types of theoretical framework:

- **Causal theories** specify a mechanism — a causal pathway by which one variable produces another. These are the only theories that can be tested in the strict hypothetico-deductive sense (e.g., Self-Determination Theory, Central Governor Model).
- **Taxonomic frameworks** classify or organise constructs without specifying the causal mechanism. They provide a descriptive vocabulary but cannot be confirmed or disconfirmed in the same way as causal theories (e.g., Achievement Goal Theory as typically applied).
- **Mathematical theories** specify relationships in formal quantitative terms, making strong, falsifiable predictions in the Meehlian sense.
- **Paradigms** are broad metatheoretical orientations that frame questions and methods but do not generate specific testable predictions (e.g., Ecological Dynamics as a research orientation).

This distinction is critical: studies using taxonomic or paradigm frameworks should not be assessed against the same epistemological standard as studies testing causal or mathematical theories.

Theory framework type — epistemological classification of identified theoretical frameworks

Framework type	Count	%	Epistemological status
causal	292	70%	Can be tested hypothetico-deductively — specifies a causal mechanism
taxonomic	78	19%	Organises constructs — no causal mechanism specified; not strictly testable
mathematical	24	6%	Formal quantitative predictions — strong Meehlian falsifiability
paradigm	16	4%	Metatheoretical orientation — frames questions, does not generate specific predictions
absent	4	1%	NA
mechanistic explanatory model	1	0%	NA

Theory framework type by operational/contextual role — causal theories used only contextually represent a particularly notable gap

Framework type	contextual	operational

absent	4	0
causal	258	34
mathematical	21	3
mechanistic explanatory model	1	0
paradigm	16	0
taxonomic	78	0

2c: Multi-Theory Coherence

What this means. Many articles invoke multiple theories simultaneously. When this occurs, the logical relationship between them matters: **complementary** frameworks each address a different component of the phenomenon and are logically coherent together; **redundant** frameworks make similar predictions for the same hypothesis (the researcher is hedging; no single theory is being tested); **contradictory** frameworks make incompatible claims and cannot logically both be invoked. Redundancy and contradiction are markers of theoretical confusion that are rarely flagged in peer review.

Multi-theory coherence — assessed in articles citing 2+ theories (24 articles)

Multi-theory coherence	Count	%	What this means
unassessed	245	91%	Only one theory identified, or coherence not determinable
complementary	19	7%	Each theory addresses a different component — logically coherent together
redundant	5	2%	Multiple theories cited for the same prediction — no single theory being tested

Section 3: Theory Frequency Tables

Methods. All extracted theory names were passed through a normalisation step that standardises common variant spellings to a canonical form (e.g., “Self Determination Theory”, “SDT”, and “self-determination theory” are all mapped to “Self-Determination Theory”). Theories are then counted across the sample. For explicit theories, an example sentence from the sample is included to illustrate how the theory is typically invoked. For implicit theories, the model’s justification — the specific language in the text that implied the framework — is shown.

How to read this section. High counts indicate theoretically prominent frameworks in this literature. The example context column shows how the theory was used, not a definition of the theory. Consult Section 9 (Theory Database) for formal definitions. The operational/contextual columns (where present) show how often each theory is actually tested versus merely cited.

3a: Explicit Theories

Theories directly named in the article text, ordered by frequency of appearance across the sample.

Explicit theories — frequency and usage across the sample

Theory name	Times cited	Mean confidence	Example sentence from sample	Operational	Contextual
Central Governor	56	0.77	The study was	3	53

Model			conducted according to the requirements of the Declaration of Helsinki and was approved by the local Ethics Committee of University of Central Lancashire and the club from which the participants voluntee...		
Self-Determination Theory	41	0.76	This construct is a major component of Self-Determination Theory (SDT), which describes autonomy as a basic and innate need that impacts human behavior (Ryan & Deci, 2000).	4	37
Achievement Goal Theory	18	0.66	NA	0	18
Null	12	0.59	NA	0	12
Dual-Process Model	8	0.76	NA	1	7
Biopsychosocial Model	6	0.72	NA	0	6
Ecological Dynamics	6	0.72	However, it is not known whether the mechanical adaptations to eccentric exercise/training could differently affect muscle activation, an indicator of NM efficiency and fatigue, during an ecological exercise task (e.g...	0	6
Attentional Focus Theory	3	0.85	Fit individuals with a history of training, who are accustomed to high-intensity exercise, may compensate for the negative effects of fatigue on cognitive function via a reduced allocation of attentional resources (Wa...	0	3

Fatigue	3	0.85	On the other hand, the more prolonged contraction with a prior eccentric phase could lead to some fatigue perhaps favoring CON-Only during the later phase of concentric action, and this could have contributed to the c...	0	3
Force-Velocity Profile	3	0.90	Consequently, the majority of available research on the torque and cadence relationship has been conducted in the laboratory using force-velocity, 7 isokinetic, 8 or inertial load 9 sprinting-type (< 6 s) efforts.	1	2
Postactivation Performance Enhancement (Pape)	3	0.85	Postactivation performance enhancement (PAPE) is a strategy that allows for enhancing performance acutely because of completing a low-volume, high-intensity resistance exercise minutes before performing an explosive a...	0	3
Stretch-Shortening Cycle (Ssc) Theory	3	0.85	24 A stretch-shortening cycle (ECC-CON) contraction in older adults may, thus, use their disproportionately high eccentric performance and RFE to facilitate their otherwise relatively poor concentric performance.	2	1
Constraints-Led Approach	2	0.85	NA	0	2
Mental Fatigue	2	0.85	Cognitive executive function involves three characteristics:	1	1

			shifting of mental sets, monitoring and updating of working memory representations, and inhibition of prepotent responses (Miyake et al., 2000).		
Mental Fatigue (Mf)	2	0.85	Cognitive executive function involves three characteristics: shifting of mental sets, monitoring and updating of working memory representations, and inhibition of prepotent responses (Miyake et al., 2000).	0	2
Optimal Theory	2	0.85	15 The optimal rehabilitation protocol after an acute Achilles tendon rupture remains undetermined.	1	1
Signal Detection Theory	2	0.85	Additionally, the exclusion criteria for the study have also been previously employed [13] and included: (i) long-term injured player data, (ii) joining the team late in either of the study seasons, (iii) lack of full...	0	2
Stretch-Shortening Cycle	2	0.85	24 A stretch-shortening cycle (ECC-CON) contraction in older adults may, thus, use their disproportionately high eccentric performance and RFE to facilitate their otherwise relatively poor concentric performance.	0	2
3d Mot Training Theory	1	0.85	One training modality that was favorably mentioned by both reviews is three-	1	0

			dimensional multiple object tracking (3D MOT).		
Accentuated Eccentric Loading (Ael)	1	0.85	Since the mid-2000s, it has been shown that it could be possible to exercise in hypoxia while remaining in a normoxic environment when using a voluntary hypoventilation at low lung volume (VHL).6-8 This method, which ...	0	1
Anabolic Resistance	1	0.85	9 The effect of such muscular contractions to failure on muscle strength gains is supported by evidence from studies which observed the accumulation of by-products such as lactate, hydrogen ions, 10 inorganic phosphat...	0	1
Analogies In Coaching	1	0.65	In addition to this, a relatively underexplored issue in the literature relating to the coaching of motor skills is the utilisation of analogies to communicate the goal of a specific coaching instruction.	0	1
Androgenic Effects On Muscle Function	1	0.85	[8] found that supplementation of ELJ in the form of a drink containing 0.3 mg/kg body weight consumed every 20 min Effects of Eurycoma longifolia Jack supplementation on eccentric leg press exercise-induced muscle da...	0	1
Antioxidant Effects Of Eurycoma	1	0.85	[1][2][3] One such supplement is	0	1

Longifolia Jack (Elj)			astaxanthin, a liposoluble carotenoid usually supplemented through the intake of Haematococcus pluvialis-derived antioxidant products.		
Arthrogenic Muscle Inhibition	1	0.85	5,7 Similarly, AKP not only reduces physical activity levels 8 and health-related quality of life 9 by itself, but it also induces an arthrogenic muscle response, especially in the quadriceps.	0	1
Arthrogenic Muscle Response	1	0.85	5,7 Similarly, AKP not only reduces physical activity levels 8 and health-related quality of life 9 by itself, but it also induces an arthrogenic muscle response, especially in the quadriceps.	0	1
Bayesian Statistics	1	0.85	Using Bayesian statistics and tennis as an example, Körding (2007) proposed that athletes usually combine prior known (nonkinematic) information with current visual (kinematic) information when they predict where the ...	0	1
Bidirectional Influence Between Sleep And Autonomic Nervous System	1	0.85	Furthermore, it has been reported that sleep and the autonomic nervous system (ANS) influence each other in a bidirectional fashion (for review see Trinder et al.	0	1
Biomechanical Adaptation To Footwear And Strike Pattern	1	0.85	The PF leg demonstrated a continuous increment in maximal AT strain	0	1

			(i.e., higher mechanical demand) over time along with lack of adaptation in its biomechanical properties.		
Biomechanical Adaptations In Overhead Athletes	1	0.75	The PF leg demonstrated a continuous increment in maximal AT strain (i.e., higher mechanical demand) over time along with lack of adaptation in its biomechanical properties.	0	1
Biomechanical Analysis Of Jump-Landing Task	1	0.85	The PF leg demonstrated a continuous increment in maximal AT strain (i.e., higher mechanical demand) over time along with lack of adaptation in its biomechanical properties.	0	1
Biomechanical Models Of Landing Mechanics	1	0.65	The PF leg demonstrated a continuous increment in maximal AT strain (i.e., higher mechanical demand) over time along with lack of adaptation in its biomechanical properties.	0	1
Biomechanical Models Of Tendon Function	1	0.85	The PF leg demonstrated a continuous increment in maximal AT strain (i.e., higher mechanical demand) over time along with lack of adaptation in its biomechanical properties.	0	1
Biomechanical Principles Of Joint Rom And Muscle	1	0.65	The PF leg demonstrated a continuous	0	1

Stiffness			increment in maximal AT strain (i.e., higher mechanical demand) over time along with lack of adaptation in its biomechanical properties.		
Biomechanical Properties Of Muscles	1	0.65	The PF leg demonstrated a continuous increment in maximal AT strain (i.e., higher mechanical demand) over time along with lack of adaptation in its biomechanical properties.	0	1
Biomechanical Risk Factors For Acl Injuries	1	0.85	The PF leg demonstrated a continuous increment in maximal AT strain (i.e., higher mechanical demand) over time along with lack of adaptation in its biomechanical properties.	0	1
Biomechanical Similarity Hypothesis	1	0.85	The PF leg demonstrated a continuous increment in maximal AT strain (i.e., higher mechanical demand) over time along with lack of adaptation in its biomechanical properties.	0	1
Biomechanics Of Throwing	1	0.85	10,11 Persistent quadriceps weakness and inhibi-tion should be clinically addressed, as these have been associated with altered lower extremity biomechanics 12 and decreased self-reported function.	0	1

Bone Remodeling Theory	1	0.70	Introduction The dynamic nature of bone turnover induced by exercise or physical training consists of skeletal and endocrine responses to internal and external loading stimuli (Proff & Römer, 2009;Smith et al., 2021) ...	0	1
Brain Mechanisms Of Attention And Emotion Regulation	1	0.85	Titrating the optimal heat dose is also crucial to preserve the health of athletes, particularly with regard to maintaining the integrity of the brain.	0	1
Cardiac Strain And Performance Parameters	1	0.85	[1][2][3] However, functional overreaching has been demonstrated to result in an inferior supercompensation following recovery compared with acute fatigue 3 and is accompanied by additional maladaptive physiological s...	0	1
Cardiovascular Health Benefits Of Resistance Exercise	1	0.85	Although a large body of literature has suggested significant cardiovascular strain in SSG with greater playing areas, it is unknown whether this is the case for mechanical loading indices.	0	1
Central Neuromuscular Control Theory	1	0.70	The study was conducted according to the requirements of the Declaration of Helsinki and was approved by the local Ethics Committee of University of Central Lancashire and the club from	0	1

			which the participants voluntee...		
Central Pattern Generator Theory	1	0.85	The study was conducted according to the requirements of the Declaration of Helsinki and was approved by the local Ethics Committee of University of Central Lancashire and the club from which the participants voluntee...	0	1
Cerebellar Function Theory	1	0.85	Another theory is that cerebellar dysfunction leads to disruption of afferent and efferent feedback loops that may result in the development of poor motor patterns and subsequent LE injury.	0	1
Cluster Set (Cs) Vs Traditional Set (Ts) Theory	1	0.85	Rest redistribution (RR) can be a practical alternative set structure when using AEL because it does not extend total rest period, unlike basic cluster sets (12,33), while acutely maintaining concentric kinetics and k...	0	1
Cognitive Brain Mechanisms	1	0.85	Introduction Cognitive dysfunction, as seen in mild cognitive impairment and cognitive function disorder, is a prominent factor that indicates poor prognosis in older individuals and patients with chronic diseases (De...	0	1
Cognitive Component Skills Theory	1	0.85	Introduction Cognitive dysfunction, as seen	1	0

			in mild cognitive impairment and cognitive function disorder, is a prominent factor that indicates poor prognosis in older individuals and patients with chronic diseases (De...		
Cognitive Control Theory	1	0.85	Introduction Cognitive dysfunction, as seen in mild cognitive impairment and cognitive function disorder, is a prominent factor that indicates poor prognosis in older individuals and patients with chronic diseases (De...	0	1
Cognitive Style Theory	1	0.85	Introduction Cognitive dysfunction, as seen in mild cognitive impairment and cognitive function disorder, is a prominent factor that indicates poor prognosis in older individuals and patients with chronic diseases (De...	0	1
Compliance And Resilience Theory	1	0.85	However, pharmacological treatments are long, expensive, and involve reliance on patient persistence and compliance.	0	1
Compression Garment Theory	1	0.85	Swimming is also characterized by a horizontal body position and thorax compression because of the hydrostatic pressure generated by the water around the chest.	0	1
Constrained Action Hypothesis	1	0.85	Further, this approach does not	0	1

			limit vGRF measurements to a treadmill at constrained speed or to a few steps over a force plate in the laboratory, which may not be representative of normal running.		
Coupling/Decoupling Interactions Model	1	0.85	For assessing multi-limb task complexity, we based our study on the model of coupling/decoupling interactions (Boisgontier et al., 2014).	0	1
Critical Intensity	1	0.85	The information would be critical for coaches and practitioners involved with the development and transitioning of players from sub-elite to the elite level.	0	1
Critical Power And Maximum Lactate Steady State (Mlss)	1	0.85	The information would be critical for coaches and practitioners involved with the development and transitioning of players from sub-elite to the elite level.	0	1
Critical Torque And Curvature Constant (W')	1	0.85	The information would be critical for coaches and practitioners involved with the development and transitioning of players from sub-elite to the elite level.	1	0
Cross-Education	1	0.85	Cross-education and global training effects have been studied in youth (4)(5)(6)13,14,44).	1	0
Davis's Law	1	0.85	3 According to Davis's law, the capsule may begin	0	1

			to adapt and hypertrophy because of repetitive loading.		
Degenerate Action Repertoire	1	0.85	It stands to reason that when capable of producing more variable, degenerate actions, there is an increased likelihood that some of those actions are comparatively unique or rare, and thus recognized as creative (Orth...	0	1
Delayed Onset Muscle Soreness (Doms) Model	1	0.85	Standard accelerated rehabilitation does not appear to prevent the loss of muscle mass and function, and most of the elongation occurs during the first 3 to 6 months after surgery, which prompts the question if the in...	0	1
Delayed Onset Muscle Soreness (Doms) Theory	1	0.85	Standard accelerated rehabilitation does not appear to prevent the loss of muscle mass and function, and most of the elongation occurs during the first 3 to 6 months after surgery, which prompts the question if the in...	0	1
Dispositional Mindfulness	1	0.85	In contrast, trait mindfulness (known as dispositional mindfulness, DM), is defined as " … tendency for having an open or receptive awareness and attention, which is reflected in a more regular or sustained conscious...	0	1
Dose-Response Model	1	0.85	19 Taken together, the existing literature suggests a potential dose-	1	0

			response relationship, where low-to-moderate levels of immersion temperature (36°C-39°C) may have limited effects on muscle recovery, while a more s...		
Dual-Mode Theory	1	0.85	Specifically, the Dual-Mode Theory suggests that affective valence is generally steady and positive as exercise intensity increases up to the anerobic threshold and begins to decline and/or become negative beyond the ...	0	1
Duty Factor In Running Kinematics	1	0.65	Furthermore, no study has incorporated duty factor (DF) in its kinematic analyses.	0	1
Dynamic Postural Stability	1	0.85	3 This condition is characterized by a wide spectrum of long-term sensorimotor and mechanical deficits that cause the ankle joint to "give way" or subjective feelings of ankle-joint instability during functional or ...	0	1
Eccentric Contraction Theory	1	0.85	[26][27][28] Thirdly, a stretch reflex response to the prior eccentric contraction could enhance concentric phase neural activation and performance.	0	1
Effect Of Napping On Hrv And Autonomic Balance	1	0.65	(2010) had also studied the effect of using a floater and uneven teams with different player numbers on the same relative pitch size, hoping to quantify the effect of imposed	0	1

			imbalances had on training outputs.		
Energy Absorption And Generation At Mtpj	1	0.65	Heart rate, however, has been questioned with regards to applicability to soccer training and match-play given the inherently intermittent movement pattern that comprises a significant anaerobic energy contribution (A...	0	1
Energy Balance And Nutrition	1	0.65	Heart rate, however, has been questioned with regards to applicability to soccer training and match-play given the inherently intermittent movement pattern that comprises a significant anaerobic energy contribution (A...	0	1
Exercise Volume-Dependent Cardiac Responses	1	0.85	Initial research using this technology has emphasised the need for exercise over rest in SSG of greater RPA with a higher total distance covered (TDC) and at higher speeds (Casamichana and Castellano 2010).	0	1
Exercise-Induced Muscle Damage (Eimd) Theory	1	0.85	Thus, we hypothesized that the degree of exercise-induced IC improvements would be greater following LV-HIIE than following MCE.	0	1
Fatigue Accumulation Theory	1	0.85	On the other hand, the more prolonged contraction with a prior eccentric phase could lead to some fatigue perhaps favoring CON-Only during the later phase of	0	1

			concentric action, and this could have contributed to the c...		
Fatigue Theory	1	0.85	On the other hand, the more prolonged contraction with a prior eccentric phase could lead to some fatigue perhaps favoring CON-Only during the later phase of concentric action, and this could have contributed to the c...	0	1
Fick Equation	1	0.85	Introduction A wealth of research has shown that the hypohydration of >2% body mass loss impairs aerobic exercise performance, primarily in warm and hot environments (Cheuvront & Kenefick, 2014;Funnell et al., 2019;Ja...	0	1
Flywheel Neuromuscular Training (Fnmt)	1	0.85	In contrast, flywheel resistance training devices have mostly been used in training programs to improve performance during the eccentric phase of the movement [4].	1	0
Flywheel Resistance Training	1	0.85	In contrast, flywheel resistance training devices have mostly been used in training programs to improve performance during the eccentric phase of the movement [4].	0	1
Flywheel Resistance Training Device	1	0.85	In contrast, flywheel resistance training devices have mostly been used in training programs to improve	0	1

			performance during the eccentric phase of the movement [4].		
Flywheel Training	1	0.85	In contrast, flywheel resistance training devices have mostly been used in training programs to improve performance during the eccentric phase of the movement [4].	0	1
Foot Core System	1	0.85	7,8 This increases the propensity for an LAS because the foot's center of pressure could continue to deviate laterally during ground contact, increasing the moment arm of the subtalar joint.	0	1
Frontal Midline Theta (Fmθ) Activity	1	0.85	(14) These appetitive and reluctant responses to exercise may be found in a context of distinct prefrontal cortex (PFC) activation patterns referred to as PFC asymmetry.	0	1
Gas Exchange Threshold (Get) And Maximum Metabolic Steady State	1	0.85	Ventilatory thresholds (VT1 and VT2) were determined using gas exchange parameters.	0	1
Goal-Action Coupling	1	0.85	The coupling of intended goals to movement actions (goal-action coupling) is influenced, among other things, by what the performer focuses on during the preparation of movement execution (Wulf & Lewthwaite, 2016).	0	1
Heart Rate Variability (Hrv) As A	1	0.85	Previous research has examined physiological (heart	0	1

Psychophysiological Marker Of Well-Being			rate and blood lactate) and subjective responses to traditional SSG with goalkeepers, with some reporting higher physiological cost and rate of perceived exertion (R...		
Heat Acclimation	1	0.85	6 Conversely, thermotherapy in the form of passive hot water immersion (HWI), hot waterperfused cuff, microwave diathermy, sauna, or heat pad have gained interest as a way to promote muscle recovery, despite current l...	0	1

Joint Work Redistribution	1	0.85	3 Similarly, in osteoarthritis, one of the most common age-related musculoskeletal conditions, power has also been found to be a better predictor, than strength, of whole-body physical function, 4 self-reported functi...	0	1
Joint Work Theory	1	0.85	3 Similarly, in osteoarthritis, one of the most common age-related musculoskeletal conditions, power has also been found to be a better predictor, than strength, of whole-body physical function, 4 self-reported functi...	1	0
Kinetic Chain Theory	1	0.85	Individuals with chronic ankle instability (CAI) displayed altered ankle-joint kinetics and greater proximal-joint stiffness than healthy control participants during the stance phase of a side-cutting task.	0	1
Leg Stiffness And Running Economy	1	0.85		INTRODUCTION As people age, muscle power invariably declines 1 with low leg muscle power associated with increased fall risk, 2 loss of mobility and impaired functional	0	1

			independence of older adults.		
Machine-Based Neuromuscular Training (Mnmt)	1	0.85	10 Based on several meta-analyses, 11,12 a greater effectiveness of flywheel neuromuscular training (FNMT) over machine-based neuromuscular training (MNMT) (eg free weights and weight stack training) remains unclear.	1	0
Massage Therapy Theory	1	0.85	One such aid is massage.	0	1
Mathematical Geometry Models Of Cardiac Function	1	0.85	Research with mathematical geometry models suggested that GCS makes a relatively greater contribution to SV and EF (Stokke et al., 2017).	0	1
Mechanical Adaptations Theory	1	0.85	Although a large body of literature has suggested significant cardiovascular strain in SSG with greater playing areas, it is unknown whether this is the case for mechanical loading indices.	1	0
Mechanical Advantage Theory	1	0.85	Although a large body of literature has suggested significant cardiovascular strain in SSG with greater playing areas, it is unknown whether this is the case for mechanical loading indices.	0	1
Mechanical Loading Theory	1	0.85	Although a large body of literature has suggested significant cardiovascular strain in SSG with greater playing areas, it is unknown	0	1

			whether this is the case for mechanical loading indices.		
Mechanical Properties Of Muscles And Joints	1	0.55	Although a large body of literature has suggested significant cardiovascular strain in SSG with greater playing areas, it is unknown whether this is the case for mechanical loading indices.	0	1
Mechanics Of Jumping And Take-Off Performance	1	0.65	3 Similarly, in osteoarthritis, one of the most common age-related musculoskeletal conditions, power has also been found to be a better predictor, than strength, of whole-body physical function, 4 self-reported functi...	0	1
Mindfulness-Based Intervention (Mbi)	1	0.85	Mindfulness-based intervention (MBI) and psychological skills training (PST) are common strategies to cope with unwanted mental states (e.g., anxiety, worry) and increase focus on current tasks in sports (Gross et al....	1	0
Mitochondrial Biogenesis Theory	1	0.85	Higher exercise intensities induce greater disturbances in skeletal muscle homeostasis, [9][10][11] and the initial acute responses involved in mitochondrial biogenesis are associated with metabolic stress.	0	1
Modified Perceptual Training Framework	1	0.85	Visual preference measured by the Visualizer-Verbalizer Questionnaire (VVQ, modified by Kirby, Moore, &	0	1

			Schofield, 1988) was shown to be positively correlated with BOLD activity at cortical areas associated with visua...		
Moment Of Inertia Effects On Kinetics And Kinematics	1	0.85	Furthermore, high-intensity actions such as sprints, accelerations and decelerations are associated with the crucial moments of matchplay, such as goal scoring, assisting, and defensive scenarios [4][5][6].	0	1
Motor Imagery Theory	1	0.85	The differences in ankle-joint kinetics and hip-joint stiffness provide insight into potential movement adaptations that occur during a side-cutting task due to the sensorimotor and mechanical constraints of CAI.	0	1
Motor Simulation Theory	1	0.85	The differences in ankle-joint kinetics and hip-joint stiffness provide insight into potential movement adaptations that occur during a side-cutting task due to the sensorimotor and mechanical constraints of CAI.	0	1
Movement-Related Cortical Potential (Mrcp)	1	0.85	A specific type of ERP, known as the movement-related cortical potential (MRCP), shows particular promise for exploring the relationship between mental fatigue and physical performance.	0	1
Multifactorial Cause Of Patellofemoral Pain	1	0.85	Furthermore, it is widely accepted that the physical demands of soccer	0	1

			are multifactorial, and these demands may vary depending on the tactical formation, opponent standard and other contextual factors [13][14][15][16...		
Multifactorial Model Of Sports Performance	1	0.65	Furthermore, it is widely accepted that the physical demands of soccer are multifactorial, and these demands may vary depending on the tactical formation, opponent standard and other contextual factors [13][14][15][16...	0	1
Muscle Adaptation Theory	1	0.85		INTRODUCTION As people age, muscle power invariably declines 1 with low leg muscle power associated with increased fall risk, 2 loss of mobility and impaired functional independence of older adults.	0	1
Muscle Fatigue And Torque Degeneration	1	0.85		INTRODUCTION As people age, muscle power invariably declines 1 with low leg muscle power associated with increased fall risk, 2 loss of mobility and impaired functional independence of older adults.	0	1
Muscle Protein Synthesis (Mps) And Muscle Protein Breakdown (Mpb)	1	0.85		INTRODUCTION As people age, muscle power invariably declines 1 with low leg muscle power associated with increased fall risk, 2 loss of mobility and impaired functional independence of	0	1

			older adults.		
Muscle Synergy Theory	1	0.85		INTRODUCTION As people age, muscle power invariably declines 1 with low leg muscle power associated with increased fall risk, 2 loss of mobility and impaired functional independence of older adults.	0	1
Music And Arousal Theory	1	0.85	Auditory stimuli such as music and podcasts have been widely applied in the realm of exercise and sport (Karageorghis, 2016).	0	1
National Sleep Foundation Recommendations	1	0.85	No data from international camps (training or matches) was included.	0	1
Neural Adaptations Theory	1	0.85	[26][27][28] Thirdly, a stretch reflex response to the prior eccentric contraction could enhance concentric phase neural activation and performance.	1	0
Neural Adaptations To Training	1	0.65	[26][27][28] Thirdly, a stretch reflex response to the prior eccentric contraction could enhance concentric phase neural activation and performance.	0	1
Neurocognition	1	0.85	7 However, neurocognition has been explored as a potential influencing factor in lower extremity injury risk.	0	1
Neuromuscular Efficiency (Nme)	1	0.85	For older adults performing RE, we recently found that fast ballistic	0	1

			contractions (i.e., where the load is projected/thrown) generated superior neuromuscular power compared with both conventional and slow controlled,...		
Neuromuscular Fatigability	1	0.85	For older adults performing RE, we recently found that fast ballistic contractions (i.e., where the load is projected/thrown) generated superior neuromuscular power compared with both conventional and slow controlled,...	0	1
Neuromuscular Fatigue	1	0.85	For older adults performing RE, we recently found that fast ballistic contractions (i.e., where the load is projected/thrown) generated superior neuromuscular power compared with both conventional and slow controlled,...	0	1
Neuromuscular Synergies And Quadriceps-Hamstring Activation Balance	1	0.85	For older adults performing RE, we recently found that fast ballistic contractions (i.e., where the load is projected/thrown) generated superior neuromuscular power compared with both conventional and slow controlled,...	0	1
Nitric Oxide Theory	1	0.85	• The results of this study suggest that BJ supplementation has the potential to improve resistance training quality which could translate into improved strength and power	0	1

			following a resistance training intervention ...		
None	1	0.85	In addition, several studies have shown that elite or higher-level handball players have greater body mass, possess greater fat-free mass, are stronger, faster, more powerful, and have greater throwing velocity compar...	0	1
Nonlinear Analyses	1	0.85	16 However, Slifkin and Newell 16 identified that there is an irregular temporal structure in muscle force fluctuations, suggesting that nonlinear analyses are necessary.	1	0
Nordic Hamstring Exercise	1	0.85	An innovative mode of exercise that exerts potentially large impacts on both functions is Nordic walking exercise conducted in water.	0	1
Normative Values	1	0.55	Research is needed to characterize scapular muscle-activity values and ratios in this athletic population to establish normative values and to compare these values with those of a nonathletic population to enhance ins...	0	1
Overreaching Model	1	0.85	1 However, with insufficient recovery, an athlete may experience functional or non-functional overreaching, which are distinguishable from acute fatigue by a prolonged decrement in performance that	0	1

			takes several days ...		
Oxygen Availability Theory	1	0.85	However, after acute high-intensity interval exercise of equivalent energy expenditure (EE), the magnitude of excess postexercise oxygen consumption (EPOC) is larger in people who performed running than cycling (11).	0	1
Pain Theory (Sensory-Discriminative And Motivational-Affective Dimensions)	1	0.65	3 Similarly, in osteoarthritis, one of the most common age-related musculoskeletal conditions, power has also been found to be a better predictor, than strength, of whole-body physical function, 4 self-reported functi...	0	1
Passive Mtpj Stiffness	1	0.85	HIIT consisted in 1-min bouts of cycling at 100% WRpeak interspaced by 1 min of passive recovery.	0	1
Pathomechanical, Sensory-Perceptual, And Motor-Behavioral Deficits Framework	1	0.65	2 After an initial LAS, up to 80% of people sustain repeated ankle sprains, which often develop into chronic ankle instability (CAI), 3 a condition characterized by pathomechanical, sensory-perceptual, and motorbehavi...	0	1
Perception-Action Coupling Loop	1	0.85	Researchers 18 have proposed that a disruption in the perception-action coupling loop occurs after concussion and failure to reestablish this loop may increase the risk of subsequent injury.	0	1
Pettlep Imagery	1	0.85	The PETTLEP	0	1

Training			imagery training has been found effective in enhancing motor performance (e.g., Battaglia et al., 2014;Buck et al., 2016;Norouzi et al., 2019).		
Physical Fatigue (Pf)	1	0.85	Introduction Small-sided games (SSGs) are a common form of training used in soccer to elicit stimuli for technical and physical conditioning purposes.	0	1
Placebo Effect	1	0.65	[7][8][9][10][11][12] In this regard, a recent study examined the acute effects of caffeine supplementation on 100-m sprint performance in a field test using track and field sprinters, and they found that the 100-m sp...	0	1
Point-Mass Model	1	0.85	5 Although physiological responses to repeated sprinting are well studied, [6][7][8] body mechanics have received less attention and are often simplified to a point-mass model.	0	1
Post-Activation Potentiation (Pap)	1	0.85	A proposed mechanism underpinning such acute performance enhancement is post-activation potentiation (PAP).	0	1
Postactivation Potentiation (Pap)	1	0.85	Postactivation performance enhancement (PAPE) is a strategy that allows for enhancing performance acutely because of completing a low-volume, high-intensity resistance	0	1

			exercise minutes before performing an explosive a...		
Posterior Capsule Hypertrophy (Pch)	1	0.90	Integrating and averaging GRFs during the support phase, breaking, propulsive, net anteroposterior, and effective vertical impulses and mean forces, respectively, at every step were calculated.	1	0
Postural Control System Development	1	0.85	Bilateral coactivation through corticospinal pathways (11), impulse diffusion between cerebral hemispheres (12), coordination learning or postural stabilization (9), and modulation of afferents (29) have all been sugg...	0	1
Priming	1	0.85	On the contrary to PAPE, which lasts up to 12 minutes (33), the phenomenon described above enhances performance for up to 48 hours and has been termed priming (39).	0	1
Progressive Loading Model For Tendon Adaptation	1	0.85	The duration of sessions was progressively increased throughout programs: MICT: from 32 min (first week) to 44 min (last week) of continuous exercise; HIIT: from 16 (first week) to 22 (last week) 1-min bouts of interm...	0	1
Proprioceptive Theory	1	0.85	The central nervous system regulates postural control through precise integration of sensory feedback	0	1

			from visual, vestibular, and proprioceptive systems [20].		
Pst (Psychological Skills Training)	1	0.65	2000;Roepstorff et al.	0	1
Psychobiological Model Of Mental Fatigue	1	0.85	The psychobiological model of Marcora et al.	1	0
Psychomotor Efficiency And Neural Proficiency Hypotheses	1	0.85	Psychomotor efficiency, which represents reduced cognitive effort required for relatively superior performance of a movement, has previously been linked to electro-cortical measurements (e.g., Cooke et al., 2014;Crews...	0	1
Psychomotor Vigilance Test (Pvt)	1	0.85	Psychomotor efficiency, which represents reduced cognitive effort required for relatively superior performance of a movement, has previously been linked to electro-cortical measurements (e.g., Cooke et al., 2014;Crews...	0	1
Pupillometry And Cognitive Workload	1	0.65	For example, pupillometry was used to address mental workload in soccer players, resulting that a less cognitive effort (i.e., lower pupil diameter) was associated with higher values of tactical knowledge (Cardoso et al.	0	1
Rating Of Perceived Exertion (Rpe)	1	0.85	4,40,46 While the maximal force-generating capacity of a muscle is determined by its physiological cross-	0	1

			sectional area (CSA), the excursion of the muscle is proportional to its fiber length, which would affect joint ...		
Recovery Time And Performance	1	0.65	In the last 10 yr, high-intensity interval training (HIIT), which includes repeated bouts of high-intensity efforts followed by recovery, has become a popular exercise type to prevent and treat obesity-related conditi...	0	1
Relaxation Techniques	1	0.85	The rate of torque development (RTD; N•s -1) was calculated by dividing the peak torque value by Ct, whereas the half-relaxation rate (HRR; N•s -1) was measured from the end of the peak torque plateau-when applicabl...	1	0
Reliability Of Kinetic Measures	1	0.85	However, a known problem related to EO during flywheel resistance training is its accurate quantification and its reliability [7,10].	0	1
Reliability Of Measurement Techniques	1	0.55	However, a known problem related to EO during flywheel resistance training is its accurate quantification and its reliability [7,10].	0	1
Repeated Bout Effect	1	0.85	To be able to repeatedly execute such actions are key physical requirements in soccer and form decisive changes in speed that are energetically taxing (Osgnach et al.	0	1

Repeated High-Intensity Effort Ability (Rhiea)	1	0.85	To be able to repeatedly execute such actions are key physical requirements in soccer and form decisive changes in speed that are energetically taxing (Osgnach et al.	0	1
Repeated Sprint Ability (Rsa)	1	0.85	To be able to repeatedly execute such actions are key physical requirements in soccer and form decisive changes in speed that are energetically taxing (Osgnach et al.	0	1
Resistance Training In Youth Populations	1	0.75	7 To offset this age induced change in muscle power, it is widely recommended that older adults perform regular resistance exercise (RE), which typically involves isoinertial contractions, lifting and lowering a fixed...	0	1
Rest Redistribution (Rr)	1	0.85	To avoid any underestimation of physical intensity, work-rate may be further quantified with the use of global positioning systems (GPS), an area missing from earlier research (Rampinini et al.	0	1
Reticulospinal Tract (Rst) Theory	1	0.85	[12][13][14][15]18 The reticulospinal tract (RST) is a bilateral descending pathway arising from the pontomedullary reticular formation in the brainstem that projects directly and indirectly to αmotoneurons of distal ...	1	0

Reversibility Principle In Motor Learning	1	0.85	NA	0	1
Rpe Clamp Model Of Tucker (40)	1	0.85	Previous research has examined physiological (heart rate and blood lactate) and subjective responses to traditional SSG with goalkeepers, with some reporting higher physiological cost and rate of perceived exertion (R...	0	1
Running Economy	1	0.85	Higher heart rate responses were found with less player numbers, with running demands greater with more players in possession formats on the same RPA.	0	1
Sensorimotor Control Theory	1	0.85	The differences in ankle-joint kinetics and hip-joint stiffness provide insight into potential movement adaptations that occur during a side-cutting task due to the sensorimotor and mechanical constraints of CAI.	0	1
Sensorimotor Rhythm (Smr) Activity	1	0.85	The differences in ankle-joint kinetics and hip-joint stiffness provide insight into potential movement adaptations that occur during a side-cutting task due to the sensorimotor and mechanical constraints of CAI.	0	1
Sensorimotor System Theory	1	0.80	The differences in ankle-joint kinetics and hip-joint stiffness provide insight into potential movement adaptations that occur during a side-cutting task due to	0	1

			the sensorimotor and mechanical constraints of CAI.		
Sensory Reweighting	1	0.85	In the absence of visual feedback, the central nervous system should increase reliance on vestibular and proprioceptive feedback to maintain postural stability-a process known as sensory reweighting [20,21].	0	1
Sex Differences In Fatigability And Recovery	1	0.65	1 This fasting involves abstaining from food, fluid intake, engaging in sexual activities, and smoking for ~12 to 20 hours per day, depending on the geographic location and season of the year.	0	1
Sex Differences In Muscle Characteristics	1	0.55	1 This fasting involves abstaining from food, fluid intake, engaging in sexual activities, and smoking for ~12 to 20 hours per day, depending on the geographic location and season of the year.	0	1
Sodium Homeostasis And Hydration Status	1	0.85	Then, participants took the prescribed light meal, a block-type (i.e., a nutrition bar) breakfast, for a total of 200 kcal, containing carbohydrate 21.5 g, protein 4.1 g, fat: 11.1 g, and sodium 0.44 g.	0	1
Sprint Mechanics And Performance Theory	1	0.65	It involves frequent intermittent bouts of highintensity actions such as accelerations, decelerations, changes of direction, sprinting, and jumping, that are interspersed	0	1

			with phases of prolonged low-intensity aerobic...		
Static Stick Figure Model	1	0.80	22 The resulting decrease in brain oxygen delivery may worsen orthostatic intolerance, 23 posing a potential risk when athletes stand up to exit the bath.	0	1
Strength Training Theory	1	0.85	3 Similarly, in osteoarthritis, one of the most common age-related musculoskeletal conditions, power has also been found to be a better predictor, than strength, of whole-body physical function, 4 self-reported functi...	0	1
Structure Mapping Model	1	0.85	Identifying lower limb joint kinetic and energetic alterations during sport-specific tasks that isolate loading on the lateral ankle structures, such as side cutting, would further elucidate movement dynamics that are...	0	1
Supercompensation Phenomena	1	0.85	[1][2][3] However, functional overreaching has been demonstrated to result in an inferior supercompensation following recovery compared with acute fatigue 3 and is accompanied by additional maladaptive physiological s...	0	1
Support Moment Distribution	1	0.85	Based on these data and to support public health recommendations on the best exercise modalities, the aim	0	1

			of this study was to compare the effectiveness of two 12-wk isoenergetic HIIT programs (running vs cycling) on ...		
Sweat Sodium Loss Mechanism	1	0.85	A quicker running pace requires an athlete to exercise at a higher intensity, producing more metabolic heat and thus a higher sweat rate, resulting in greater hypohydration.	0	1
Task Constraints	1	0.85	Individuals with chronic ankle instability (CAI) displayed altered ankle-joint kinetics and greater proximal-joint stiffness than healthy control participants during the stance phase of a side-cutting task.	0	1
Task Difficulty	1	0.85	Individuals with chronic ankle instability (CAI) displayed altered ankle-joint kinetics and greater proximal-joint stiffness than healthy control participants during the stance phase of a side-cutting task.	0	1
Taxonomic Framework Of Motor Control	1	0.65	NA	0	1
Tendon Adaptation Theory	1	0.85	[23][24][25] Second, pre-activation during the eccentric phase that provides a high active force state at the onset of concentric action, may minimize the delay in achieving full activation and the need to remove the ...	0	1

Tendon Pathology Model	1	0.85	[23][24][25] Second, pre-activation during the eccentric phase that provides a high active force state at the onset of concentric action, may minimize the delay in achieving full activation and the need to remove the ...	0	1
Thirst And Fluid Intake Regulation	1	0.85	With these considerations in mind, the aim of this study was to determine the effect of personalized sodium replacement during ultraendurance running in the heat, on: (1) thirst and ad libitum fluid intake, (2) water ...	0	1
Time-Efficient Training Programs	1	0.75	Indeed, it is considered a time-efficient strategy to decrease FM deposits, including total abdominal FM (i.e., subcutaneous abdominal FM and visceral adipose tissues) (6)(7)(8)(9)(10).	0	1
Training Specificity Principle	1	0.85	Introduction Small-sided games (SSGs) are a common form of training used in soccer to elicit stimuli for technical and physical conditioning purposes.	0	1
Transfer Of Training	1	0.85	Introduction Transferring the positive training effects of a trained limb (i.e., strength, endurance, skill, and acceleration) to the untrained limbs has been demonstrated repeatedly and is known as crosseducation (26...	0	1

Uncontrolled Manifold (Ucm) Hypothesis	1	0.85	Unanticipated movements may lead to uncontrolled trunk and pelvis displacement during athletic movement, placing the hamstring muscles in a high-strain position and causing injury.	1	0
Unified Taxonomy Of Fatigue	1	0.85	Furthermore, the reason why previous studies have not reached a unified view on the acute effects of resistance training with different ROM on ROM and passive stiffness may be related to the difficulty of the deadlift...	0	1
Velocity-Power Relationship Theory	1	0.70	It has been identified that RSS training with an external load associated with the apex of the velocity-power relationship (L 50% vdec), which maximizes the horizontal power production (ranging from 69 to 91% of BM f...	0	1
Vibration Therapy Theory	1	0.85	Standing participants are exposed to four experimental conditions: two with a highamplitude visual stimulus and two with a low-amplitude visual stimulus, two with vibration (i.e., the proprioceptive stimulus) on and t...	0	1
Visualiser-Verbaliser Questionnaire (Vvq)	1	0.85	NA	0	1

3b: Implicit Theories

Conceptual frameworks inferred by the model from the language of the introduction, even where no theory is formally named.

Implicit theories (confidence ≥ 0.5) — inferred frameworks, frequency, and tested prediction where available

Inferred framework	Times inferred	Mean confidence	Tested prediction or role
Self-Determination Theory	8	0.67	Dispositional mindfulness will serve as a moderator and interact with visualized PETTLEP imagery in mid-range shooting performance and retention.
Central Governor Model	4	0.65	contextual
Achievement Goal Theory	2	0.62	contextual
Action Anticipation Theory	1	0.75	contextual
Attention Theory (As Applied To Motor Control)	1	0.65	High mindfulness participants will have better performance than low mindfulness participants on basketball mid-range shooting performance and retention.
Biopsychosocial Model	1	0.65	contextual
Calcium Handling And Dynamics	1	0.70	Impaired calcium handling in muscle cells leads to decreased exercise capacity, muscle function, and fatigue resistance.
Dual-Process Model	1	0.65	contextual
Ecological Validity	1	0.55	contextual
Expert Advantage Theory	1	0.75	contextual
Interference Hypothesis	1	0.65	contextual
Mental Fatigue Mechanisms	1	0.70	contextual
Muscle Damage And Recovery Mechanisms	1	0.70	Increased expression of heat shock proteins (HSP) correlates with the decline in force generating capacity after exercise.
Neuromuscular Control Strategies	1	0.65	contextual
Pain-Induced Neuromuscular Adaptations	1	0.75	contextual
Patellofemoral Pain Syndrome (Pfp)	1	0.70	contextual

3c: Operational vs Contextual Breakdown

For each theory, the proportion of articles in which it drove a specific testable prediction (operational) versus appeared only as background framing (contextual). A theory with a high contextual count relative to its operational count is being frequently name-dropped without being scientifically used.

Operational vs contextual use — a theory with a high contextual percentage is cited frequently but rarely used to generate testable predictions

Theory	Operational	Contextual	Total	% operational
Central Governor Model	3	57	60	5%
Self-Determination Theory	5	44	49	10%
NA	2	37	39	5%
Achievement Goal Theory	0	20	20	0%
Null	0	12	12	0%
Dual-Process Model	1	8	9	11%
Biopsychosocial Model	0	7	7	0%
Ecological Dynamics	0	6	6	0%
Attentional Focus Theory	0	3	3	0%
Fatigue	0	3	3	0%
Force-Velocity Profile	1	2	3	33%
Postactivation Performance Enhancement (Pape)	0	3	3	0%
Stretch-Shortening Cycle (Ssc) Theory	2	1	3	67%
Constraints-Led Approach	0	2	2	0%
Mental Fatigue	1	1	2	50%
Mental Fatigue (Mf)	0	2	2	0%
Optimal Theory	1	1	2	50%
Signal Detection Theory	0	2	2	0%
Stretch-Shortening Cycle	0	2	2	0%
3d Mot Training Theory	1	0	1	100%
Accentuated Eccentric Loading (Ael)	0	1	1	0%
Action Anticipation Theory	0	1	1	0%
Anabolic Resistance	0	1	1	0%
Analogies In Coaching	0	1	1	0%
Androgenic Effects On Muscle Function	0	1	1	0%
Antioxidant Effects Of Eurycoma Longifolia Jack (Elj)	0	1	1	0%

3d: Prediction Strength

What this means. For theories classified as operational, how constraining is the prediction they generate? A **strong** prediction specifies direction AND either a quantitative constraint or the causal mechanism by which the effect occurs. A **moderate** prediction specifies direction and conditions. A **weak** prediction is directional only ("X > Y") — the most common form in applied research and the least evidentially useful for the theory (Meehl, 1978). Rival theories acknowledged = whether the introduction explicitly reasons against alternative theoretical explanations for the same prediction.

Prediction strength — how constraining are the theoretical predictions being tested?

Prediction strength	Count	%	What this means

strong	5	1%	Directional AND quantitatively constrained or mechanistically specific
moderate	30	7%	Directional with specified conditions or moderators
weak	6	1%	Directional only — no constraint beyond expected direction
absent	380	90%	No prediction generated (contextual theory)

Rival theory acknowledgement — how often do authors reason against alternative theoretical explanations?

Metric	Count	%
Theories where rival explanations are explicitly acknowledged and reasoned against	0	0%
Theories where rival explanations are NOT addressed	421	100%

Section 4: Paper × Theory Mapping

Methods. Each extracted theory is linked to the article from which it was extracted. This table provides a complete record of every theory–article pairing, allowing readers to trace which papers cited which frameworks and in what capacity.

How to read this section. Each row represents one theory in one article. The Role column distinguishes operational (theory generates a tested prediction) from contextual (background citation). The Justification column is populated only for implicit theories and contains the model's explanation of which language implied that framework.

Complete paper × theory mapping — every theory extracted from every article

Section 5: Hypothesis–Theory Alignment

Methods. The introduction text and extracted theory list for each article were passed to the LLM with a prompt instructing it to identify explicit hypotheses or directional predictions and assess how well each is grounded in the identified theoretical framework. Linkage strength was classified as: **explicit** (the hypothesis is directly attributed to the theory in the text), **implicit** (the connection is clear but unstated), or **none** (the hypothesis has no apparent theoretical basis). Overall alignment quality was rated as **strong** (all hypotheses theoretically grounded), **partial** (some grounded, some not), or **absent** (no theoretical grounding, or no hypotheses).

How to read this section. This analysis addresses the core scientific question: are researchers deriving their hypotheses from theory? Articles with `absent` alignment are making empirical predictions without theoretical justification. Articles with `partial` alignment have mixed theoretical grounding. The detail table shows each hypothesis as extracted, its linked theory, and the model's explanation of the connection.

Hypothesis extraction summary

Metric	Count
Articles containing at least one explicit hypothesis	266
Articles with no detectable hypothesis	3
Total hypotheses extracted	466
Hypotheses with explicit theoretical link (directly attributed to a theory)	12
Hypotheses with implicit theoretical link (connection inferred but unstated)	0
Hypotheses with no theoretical link	441
Extraction failures	0

Hypothesis-theory alignment quality per article

Alignment quality	Count	%	What this means
absent	153	57%	No hypotheses, or no theoretical grounding detected
partial	112	42%	Some hypotheses are grounded in theory, others are not
strong	4	1%	All hypotheses in this article are theoretically grounded

All hypotheses — text, linked theory, and strength of theoretical grounding

Article	Hypothesis	Linked theory	Linkage	Inference	Explanation
Study001	higher physiological load will be associated with traditional SSG with goalkeepers	NA	none	consistent	The hypothesis is stated without theoretical grounding.
Study001	possession and overload drills will require a greater kinematic workload, specifically with overloaded teams	NA	none	consistent	The hypothesis is stated without theoretical grounding.
Study002	possession and team formation would affect positional match running demands	NA	none	motivated	The hypothesis is motivated by previous research but lacks a clear theoretical grounding.

Study003	ECC-CON contractions would generate greater mean power with all loads than CON-Only contractions.	NA	none	motivated	The hypothesis is motivated by the observed differences in power production between ECC-CON and CON-Only contractions in young adults, but no explicit theore...
Study004	individuals with CAI would display altered lower limb joint kinetic patterns and more proximal joint stiffness than healthy individuals serving as controls	NA	none	motivated	The hypothesis is motivated by the observed movement adaptations in individuals with CAI but lacks a specific theoretical grounding.
Study005	positional differences will exist for technical and running performance	NA	none	motivated	The hypothesis is motivated by the observed differences in running performance between positions and the belief that similar differences would exist for tech...
Study005	there will be a distinct difference between competition grades for technical and running performance	NA	none	motivated	The hypothesis is motivated by the differences in physical characteristics and training between elite and sub-elite players, suggesting that these difference...
Study006	both programs would be effective in decreasing FM deposits, including total and (intra)-abdominal FM	NA	none	consistent	The hypothesis is a general statement about the effectiveness of both programs without theoretical grounding.
Study006	the running HIIT program would induce larger effects despite similar gut microbiota composition alterations	NA	none	consistent	The hypothesis is a directional prediction about the relative effectiveness of running vs cycling without theoretical grounding.
Study007	stronger players will have a higher performance on handball-specific fitness elements compare with their weaker counterparts	NA	none	motivated	The hypothesis is motivated by the general understanding that strength positively contributes to performance in various sports, but there is no explicit theo...
Study007	strength and RFD will significantly be correlated with handball-specific fitness elements	NA	none	motivated	The hypothesis is motivated by the general understanding that strength and RFD are related to performance, but there is no explicit theoretical grounding.
Study008	both training conditions would improve performance as compared to the same training performed with unrestricted breathing	NA	none	motivated	The hypothesis is motivated by the observed benefits of RSH in previous studies but lacks a theoretical grounding.
Study008	a superiority of RSH-VHL over RS-VHH	NA	none	motivated	The hypothesis is motivated by the observed benefits of RSH in previous studies but lacks a theoretical grounding.
Study010	the greatest performance would be during the first 15-minute period of the match regardless of the playing position	NA	none	motivated	The hypothesis is motivated by practical experience and the observed patterns in performance, but no specific theoretical grounding is provided.
Study010	the lowest physical performance would be found toward the end of the match (60-75 minutes and 75-90 minutes)	NA	none	motivated	The hypothesis is motivated by practical experience and the observed patterns in performance, but no specific theoretical grounding is provided.
Study011	the degree of exercise-induced IC improvements would be greater following LV-HIIE than following MCE	NA	none	motivated	The hypothesis is motivated by previous findings on the effects of different exercise types on IC, but there is no explicit theoretical grounding.
Study012	delaying the gradual introduction of full	NA	none	motivated	The hypothesis is motivated by the

	loading by 6 weeks in the initial 26 weeks would reduce the heel-rise height difference between the injured and uninjured leg 1 year af...				observed need to minimize tendon elongation and muscle mass loss, but there is no explicit theoretical grounding.
Study013	concurrent training would induce greater EPOC in comparison with resistance or aerobic training performed in isolation, even in protocols matched for the overall EE.	NA	none	motivated	The hypothesis is motivated by practical observations and the need to address gaps in research, rather than a specific theoretical prediction.
Study014	both groups would show cross-education effects	NA	none	consistent	The hypothesis is not explicitly linked to any theory and is stated as a general expectation.
Study014	youth could show more pronounced cross-education effects	NA	none	consistent	The hypothesis is not explicitly linked to any theory and is stated as a general expectation.
Study015	use of nutrient balance allows not only for greater weight loss but will allow for a greater beneficial change in body composition (i.e., maintaining fat-free mass) versus the u...	NA	none	motivated	The hypothesis is motivated by the observed effectiveness of nutrient balance in previous studies but lacks a clear theoretical grounding.
Study016	ROTC cadets would exhibit improvements in all skeletal, body composition, and performance metrics post 6 months compared to their baseline values	NA	none	motivated	The hypothesis is motivated by the need to improve military physical readiness but lacks a theoretical grounding.
Study017	We expected a 15 ± 5% increase after MICT and a 50% superiority of HIIT.	NA	none	motivated	The hypothesis is based on previous research and practical experience, not a specific theoretical prediction.
Study018	acute caffeine supplementation would improve sprint performance, along with increases in propulsive forces as propulsive forces are determinants of sprint acceleration performance.	NA	none	motivated	The hypothesis is motivated by practical observations and empirical findings, rather than a direct logical derivation from any theory.
Study019	both low-and high-load muscular contractions until failure would result in similar alterations in muscle thickness, pennation angle, and muscle strength while tendon adaptation ...	NA	none	consistent	The hypothesis is not explicitly linked to any theory and is based on previous observations.
Study020	There would be differences in the activation of scapular and shoulder muscles, as well as in activation ratios, between LP and HP variations, and as body weight support increased.	NA	none	motivated	The hypothesis is motivated by the observed activation imbalances in previous studies and the need to select optimal exercises for shoulder rehabilitation, b...
Study021	RT can be safely practiced during Ramadan in both FED and FAST while maintaining muscle strength and hypertrophy	NA	none	motivated	The hypothesis is motivated by practical experience and the need to maintain physical outcomes during Ramadan, but there is no explicit theoretical grounding.
Study021	There are larger increases in muscle strength and hypertrophy when training in the FED compared with the FAST	NA	none	motivated	The hypothesis is motivated by practical experience and the need to optimize training outcomes, but there is no explicit theoretical grounding.
Study022	overreached endurance athletes would have a reduced respiratory exchange ratio (RER) during submaximal exercise,	NA	none	motivated	The hypothesis is motivated by the observed changes in substrate utilization during high-intensity interval training and

	indicating reduced carbohydrate utilization				the expected physiological adaptatio...
Study022	a CGM detectable decrease in circulating glucose during exercise	NA	none	motivated	The hypothesis is motivated by the observed changes in glucose utilization during high-intensity interval training and the expected physiological adaptations...
Study022	this response would return to baseline after a week of recovery training	NA	none	motivated	The hypothesis is motivated by the expected physiological recovery from overreaching, but there is no explicit theoretical grounding.
Study023	RT protocols with lower numbers of repetitions per set and longer rest times would elicit lower mechanical (velocity loss) and metabolic (blood lactate concentration) fatigue th...	NA	none	motivated	The hypothesis is motivated by practical observations and empirical findings, rather than being derived or consistent with a specific theory.
Study024	The effect of caffeine to enhance fat oxidation during submaximal aerobic exercise is of similar magnitude with 3 and 6 mg of caffeine per kg of body mass.	NA	none	consistent	The hypothesis is not explicitly linked to any theory and is based on empirical findings.
Study025	collagen protein ingestion increases postexercise muscle connective protein synthesis rates	NA	none	motivated	The hypothesis is motivated by the argument that collagen protein, due to its high glycine and proline content, may be more effective in stimulating muscle c...
Study025	whey protein ingestion increases postexercise myofibrillar protein synthesis rates	NA	none	motivated	The hypothesis is motivated by the established knowledge that protein ingestion during recovery increases myofibrillar protein synthesis rates.
Study026	participants in both the recent concussion and concussion history groups would display sensory reweighting impairments relative to the control group	NA	none	motivated	The hypothesis is motivated by previous observations of chronic postural control impairments in eyes closed conditions, but there is no explicit theoretical ...
Study027	both HWI modalities would increase heat and cardiovascular strain, with HWI 41 but not HWI 40 mitigating EIMD-induced decline in strength parameters and soreness	NA	none	motivated	The hypothesis is motivated by the practical need to find an optimal heat dose for recovery, but there is no explicit or implicit theoretical grounding.
Study028	HED consumption would improve the research variables in soccer players.	NA	none	motivated	The hypothesis is motivated by the belief that energy drinks can improve performance, but there is no explicit theoretical grounding.
Study029	Due to greater oxygen availability within the muscle, females would demonstrate a higher critical intensity than men when expressed relative to MVC.	Critical Intensity	explicit	consistent	The hypothesis is consistent with the theory as it aligns with physiological differences between sexes, such as greater capillarisation and oxygenation.
Study029	There would be no sex difference in the time to task failure when the tasks were compared at the same metabolic intensity of contraction, relative to critical intensity.	NA	none	motivated	The hypothesis is motivated by the theory but lacks a direct logical or causal relationship.
Study029	Recovery from fatiguing exercise would be more rapid in females than males due to the properties of contractile elements of the muscle.	NA	none	motivated	The hypothesis is motivated by physiological differences but lacks a direct logical or causal relationship.

Study030	supplementation with 12 mg•day -1 astaxanthin for 7 days can improve cycling TT performance	NA	none	motivated	The hypothesis is motivated by the practical implications and previous studies, but there is no explicit theoretical grounding.
Study031	neural and mechanical adaptations conferred by the repeated bout effect would be greater in RF than VL due to exercise model specificity	NA	none	motivated	The hypothesis is motivated by the specific exercise model but lacks a theoretical grounding.
Study031	a lesser cardio-metabolic demand and perceived exertion responses during the second exercise bout compared to the first	NA	none	motivated	The hypothesis is motivated by previous findings but lacks a theoretical grounding.
Study032	the immobilization would exacerbate muscle damage indicated by changes in indirect markers of muscle damage and proprioception after MaxEC when compared with the control conditi...	NA	none	motivated	The hypothesis is motivated by the background information on muscle damage and immobilization effects but lacks a direct theoretical grounding.
Study033	acute high-volume sets to failure would induce perturbations in cardiac function and increase wall thickness for up to 24 h	NA	none	motivated	The hypothesis is motivated by the need to understand chronic adaptations but lacks a clear theoretical grounding.
Study033	RE would increase circumferential shorting and decrease the afterload, as relatively significant contributions to post-exercise cardiac performance	NA	none	motivated	The hypothesis is motivated by the need to understand chronic adaptations but lacks a clear theoretical grounding.
Study034	both the severity and duration of AKP would be associated with quadriceps function and self-reported function	NA	none	consistent	The hypothesis is based on observed relationships between AKP severity and duration with quadriceps function and self-reported function, without explicit the...
Study034	a combination of high severity and long duration of AKP would lead to additional deficits in quadriceps function and self-reported function	NA	none	consistent	The hypothesis is based on observed relationships between AKP severity and duration with quadriceps function and self-reported function, without explicit the...
Study035	the traditional (TRT) condition will provide a greater decline in neuromuscular performance than the alternated (ART) condition	NA	none	motivated	The hypothesis is motivated by the need to compare different RT conditions but lacks a theoretical grounding.
Study035	the TRT condition would provide greater RPE than the ART condition	NA	none	motivated	The hypothesis is motivated by the need to compare different RT conditions but lacks a theoretical grounding.
Study035	the ART condition increases the magnitude of reductions in BP when compared with the TRT condition	NA	none	motivated	The hypothesis is motivated by the need to compare different RT conditions but lacks a theoretical grounding.
Study036	the more mature boys would exhibit better DJ kinetics and SSC function compared with their less mature counterparts	NA	none	motivated	The hypothesis is motivated by the observed differences in maturity status and performance but lacks a theoretical grounding.
Study037	a cumulative effect of multiple exercise bouts would have a negative effect on cognitive performance and mood on day 2 compared to day 1	NA	none	motivated	The hypothesis is motivated by the need to investigate cumulative effects of exercise on cognitive performance and mood, but there is no explicit theoretical...
Study037	there would be a compounding effect of exercise-induced fatigue on cognitive	NA	none	motivated	The hypothesis is motivated by the need to investigate the compounding effects of

	function post-exercise compared to pre-exercise, with the effect increasing across sessions on day 1...				exercise-induced fatigue on cognitive function, but there is no explicit th...
Study038	2 AEL 1 RR conditions would result in greater concentric force, velocity, and power compared with TS.	NA	none	motivated	The hypothesis is motivated by the observed acute mechanical responses to AEL and RR in previous studies, but there is no explicit theoretical grounding.
Study038	AEL 1 RR that prescribed 5 AEL repetitions would cause the greatest concentric force, velocity, and power among all 3 conditions, given potentially more frequent potentiation an...	NA	none	motivated	The hypothesis is motivated by the observed acute mechanical responses to AEL and RR in previous studies, but there is no explicit theoretical grounding.
Study039	the contralateral-perturbation direction and the upper-trunk location would show greater ACL loading variables compared to ipsilateral-perturbation and no-perturbation direction...	NA	none	motivated	The hypothesis is motivated by the need to understand the effect of external trunk perturbation on ACL loading variables, but there is no explicit or implici...
Study039	contralateral perturbation to the upper trunk would result in decreased cutting velocities and increased stance time compared to other perturbation directions and locations	NA	none	motivated	The hypothesis is motivated by the need to understand the effect of external trunk perturbation on cutting performance, but there is no explicit or implicit ...
Study040	ingesting carbohydrates during standardized exercise with and without exhaustion would maintain carbohydrate availability	NA	none	motivated	The hypothesis is motivated by practical experience and the aim of maintaining carbohydrate availability, but there is no explicit theoretical grounding.
Study040	ingesting carbohydrates during standardized exercise with and without exhaustion would reduce protein degradation	NA	none	motivated	The hypothesis is motivated by practical experience and the aim of reducing protein degradation, but there is no explicit theoretical grounding.
Study040	ingesting carbohydrates during standardized exercise with and without exhaustion would reduce next-day performance degradation	NA	none	motivated	The hypothesis is motivated by practical experience and the aim of reducing next-day performance degradation, but there is no explicit theoretical grounding.
Study041	an insufficient use of the legs during the swim segment could be detrimental for the following cycle segment	NA	none	motivated	The hypothesis is motivated by practical experience and common strategies among triathletes, but there is no explicit theoretical grounding.
Study041	a specific training program centered on a greater involvement of legs during the swim segment could positively affect the subsequent cycle segment because of a greater lower-bod...	NA	none	motivated	The hypothesis is motivated by practical experience and common strategies among triathletes, but there is no explicit theoretical grounding.
Study042	older adults might have decreased foot core capacities	Foot Core System	consistent	consistent	The hypothesis is consistent with the Foot Core System theory, which suggests that foot core capacities such as muscle strength and sensory inputs are requir...
Study042	older adults might adopt different neuromuscular control strategies during quiet standing	NA	none	motivated	The hypothesis is motivated by the need to compensate for the decline in foot core capacities, but there is no explicit theoretical grounding.
Study043	HIIT 4 × 4 min would improve V̇O 2max and long-distance endurance performance more than both SIT protocols	NA	none	motivated	The hypothesis is motivated by the existing evidence that HIIT has been shown to be effective in improving V̇O

					2max, but there is no explicit theoretical grou...
Study043	Both SIT protocols would improve anaerobic capacity and sprint endurance performance more than HIIT 4 × 4 min	NA	none	motivated	The hypothesis is motivated by the existing evidence that SIT can highly tax the anaerobic system, but there is no explicit theoretical grounding.
Study043	No differences between HIIT and SIT would be apparent for running economy and LT as a percentage of V̇O 2max	NA	none	motivated	The hypothesis is motivated by the existing evidence that both HIIT and SIT can improve running economy, but there is no explicit theoretical grounding.
Study044	correlations would exist between lead-leg and back-leg extension strength and upper extremity kinematics and kinetics	NA	none	consistent	The hypothesis is not explicitly linked to any theory and is based on the general understanding that strength in the lower extremities could influence upper ...
Study044	correlations would exist between peak EVT and peak shoulder internal-rotation torque with lead-hip and back-hip strength	NA	none	consistent	The hypothesis is not explicitly linked to any theory and is based on the general understanding that strength in the lower extremities could influence upper ...
Study045	those who participate in a 12-week isometric neck strengthening program will have greater strength improvements compared to those who do not	NA	none	motivated	The hypothesis is motivated by the suggestion that isometric neck strengthening programs may improve neck strength, but there is no explicit theoretical grou...
Study046	physiological and perceptual responses to pedaling cadence would follow curvilinear curves with different optimal cadences depending on the parameter considered	NA	none	consistent	The hypothesis is based on empirical observations and general physiological principles, not a specific theory.
Study046	optimal cadence would increase with power output	NA	none	consistent	The hypothesis is based on empirical observations and general physiological principles, not a specific theory.
Study047	very low-volume HIFT will attenuate cardiorespiratory adaptations but promote greater neuromuscular effects than SIT	NA	none	motivated	The hypothesis is motivated by the need to compare HIFT and SIT in real-world scenarios but lacks a theoretical grounding.
Study048	individuals with CAI would show a lower maximal isometric strength, steadiness, and accuracy of both knee extensor and flexor muscles in comparison with healthy controls.	NA	none	motivated	The hypothesis is motivated by the observed neuromuscular impairments in individuals with CAI but lacks a specific theoretical grounding.
Study049	a greater level of evoked torque would be generated by wide-pulse NMES protocols	NA	none	consistent	The hypothesis is based on empirical observations and practical experience, not a specific theory.
Study049	this higher torque would lead to greater objective fatigability as well as changes in CNS excitability compared to conventional NMES	NA	none	consistent	The hypothesis is based on empirical observations and practical experience, not a specific theory.
Study049	the high frequency protocol would induce greater objective fatigability and changes in CNS excitability than low frequency NMES	NA	none	consistent	The hypothesis is based on empirical observations and practical experience, not a specific theory.
Study050	GRF data and lower-limb joint torques and power would change during diving	NA	none	motivated	The hypothesis is motivated by practical observations and the need to characterise

	motion according to the differences in distance and height of the suspended ball.				profiles of lower-limb joint torques and power, but there is no explicit t...
Study051	patellofemoral force and stress would be greater performing ball squat than wall squat during squat descent	NA	none	motivated	The hypothesis is motivated by practical experience and the need to understand force variations between squat types, but there is no explicit theoretical gro...
Study051	patellofemoral force and stress would be greater in wall squat than ball squat during squat ascent	NA	none	motivated	The hypothesis is motivated by practical experience and the need to understand force variations between squat types, but there is no explicit theoretical gro...
Study051	patellofemoral force and stress would be greater with short HTWD than long HTWD	NA	none	motivated	The hypothesis is motivated by practical experience and the need to understand force variations with different HTWD, but there is no explicit theoretical gro...
Study052	the torque and cadence relationship would also be significantly different, particularly for the longest efforts	NA	none	consistent	The hypothesis is based on observed differences in PO profiles and endurance durability between cyclists of different performance levels and rider types, but...
Study053	electrically evoked contractile output would be impaired less and recover sooner in comparison with voluntary contractile output	NA	none	motivated	The hypothesis is motivated by the need to understand recovery differences between voluntary and electrically evoked contractions, but there is no explicit t...
Study054	WBC-RSH would improve performance during exercise in hypoxia compared with RSH and RSH-WBC, through an increase in muscle oxygenation	NA	none	motivated	The hypothesis is motivated by the known effects of WBC on muscle oxygenation and performance, but there is no explicit theoretical grounding.
Study054	RSH-WBC would induce improved sleep compared to RSH and control night	NA	none	motivated	The hypothesis is motivated by the known effects of WBC on sleep, but there is no explicit theoretical grounding.
Study054	both WBC conditions would enhance recovery of HRV indices compared to RSH	NA	none	motivated	The hypothesis is motivated by the known effects of WBC on HRV, but there is no explicit theoretical grounding.
Study055	an effect of wetsuit use on biomechanical variables that would mitigate fatigability in front crawl at preset speed compared with swimsuit	NA	none	consistent	The hypothesis is based on empirical findings and practical observations rather than a specific theoretical framework.
Study055	wetsuit use could decrease the comfort and motor coordination of triathletes	NA	none	consistent	The hypothesis is based on empirical findings and practical observations rather than a specific theoretical framework.
Study056	the kinetic and kinematic outputs will vary across the loads used	NA	none	motivated	The hypothesis is motivated by practical observations and the need to understand how different loads affect performance, but there is no explicit theoretical...
Study056	the EO level is variable-and load-dependent	NA	none	motivated	The hypothesis is motivated by practical observations and the need to understand how different loads affect EO, but there is no explicit theoretical grounding.
Study057	the higher the oxidative component of RSE (i.e., the shorter the sprint duration and consequently the recovery duration), the larger the hypoxia-induced decrement in RSE perform...	NA	none	consistent	The hypothesis is based on the observed relationship between sprint duration and oxidative-glycolytic balance, but no explicit theoretical grounding is provi...

Study058	Impairments in neuromuscular function would be present during bouts of exercise at 70% and 90% GET, but that fatigability would be greater at 110% than 90% GET, with no differen...	NA	none	motivated	The hypothesis is motivated by the observed relationship between exercise intensity and neuromuscular function but lacks explicit theoretical grounding.
Study058	Impairments in subsequent exercise performance would be exacerbated in response to work-matched exercise at supra-compared with sub-GET.	NA	none	motivated	The hypothesis is motivated by the observed relationship between exercise intensity and performance but lacks explicit theoretical grounding.
Study059	the combination of Yi Jin Jing and Elastic Band Resistance exercise could improve BMD and related bone metabolic marker levels at various sites in postmenopausal women	NA	none	motivated	The hypothesis is motivated by the belief in traditional Chinese medicine and practical observations, but lacks a clear theoretical grounding.
Study060	ET would attenuate decreases in muscle function and CSA of the immobilized arm greater than CT, and ET would provide greater protective effects against muscle damage induced by ...	NA	none	motivated	The hypothesis is motivated by the observed cross-education effect and the known protective effects of ET, but there is no explicit theoretical grounding.
Study061	field hockey athletes would display altered scapular balance ratios compared with healthy nonathletes but were uncertain about the nature of these alterations	NA	none	motivated	The hypothesis is motivated by the observed differences in muscle activity and balance ratios between field hockey players and nonathletes, but no specific t...
Study062	muscular activation, perception of effort, and cardiorespiratory responses would be greater during ECC cycling exercise at 30 rpm compared with 60 rpm	NA	none	motivated	The hypothesis is motivated by previous findings but lacks a clear theoretical grounding.
Study063	exercisers given more autonomy will have more positive psychological responses compared to imposed HIIT sessions despite each session of exercise being matched for time, intensi...	Self-Determination Theory (SDT)	explicit	consistent	The hypothesis is consistent with SDT, as it predicts that autonomy will lead to better psychological outcomes, aligning with the theory's core claims.
Study065	caffeine ingestion improves pace-controlled simulated 800-m run performance by increasing ventilation, thereby reducing EIAH	NA	none	motivated	The hypothesis is motivated by the observed effects of caffeine on exercise ventilation and EIAH in treadmill running, but there is no explicit theoretical g...
Study066	hypohydration would impair running performance, compared to when euhydration was maintained with water ingestion	NA	none	consistent	The hypothesis is consistent with the general understanding that hypohydration impairs performance, but no specific theoretical framework is cited.
Study067	we hypothesized that they will also be effective in this study eliciting PAPE and priming effect.	NA	none	motivated	The hypothesis is motivated by previous studies showing the effectiveness of resisted sprints in inducing PAPE and priming, but there is no explicit or impli...
Study068	the ability to resist changes in RE would be superior in trained versus untrained runners	NA	none	motivated	The hypothesis is motivated by the observed differences in physiological resilience between trained and untrained subjects, but no specific theoretical frame...
Study068	the ability to resist changes in VO 2max would be superior in trained versus untrained runners	NA	none	motivated	The hypothesis is motivated by the observed differences in physiological resilience between trained and untrained

					subjects, but no specific theoretical frame...
Study068	the relative intensity, that is, VO 2 /attainable VO 2max, would increase more in the untrained than in the trained runners	NA	none	motivated	The hypothesis is motivated by the observed differences in physiological resilience between trained and untrained subjects, but no specific theoretical frame...
Study069	the flywheel-based program would improve more thoroughly those actions that rely highly on the stretch-shortening cycle toward performance (ie, countermovement jump [CMJ])	Stretch-Shortening Cycle	explicit	consistent	The hypothesis is explicitly linked to the Stretch-Shortening Cycle theory through its mention of actions relying on this cycle.
Study070	the AVLR and VIP of the vGRF would be significantly higher initially in the maximal shoe but that these variables would significantly decrease at the 6-week follow-up, negating ...	NA	none	motivated	The hypothesis is motivated by the need to understand biomechanical changes over time with maximal footwear, but there is no explicit theoretical grounding.
Study070	No differences between shoes or changes over time were hypothesized for ankle kinematics	NA	none	motivated	The hypothesis is motivated by the need to understand biomechanical changes over time with maximal footwear, but there is no explicit theoretical grounding.
Study071	acute changes in markers of inflammation, cellular damage, BLa, perceived pain and RPE would be greater after HIIT compared to MIIT	NA	none	motivated	The hypothesis is motivated by the observed differences in acute responses to different intensities of exercise, but there is no explicit theoretical grounding.
Study072	The hamstring and trunk muscle activities and latencies would increase when the trunk perturbations were not anticipated.	NA	none	motivated	The hypothesis is motivated by the neuromuscular response findings in individuals with a history of low back pain, but there is no explicit theoretical groun...
Study073	Preference for verbal instructions was related to changes in performance and in information processing (EEG high-alpha power and coherence at verbal and visual sites) immediatel...	NA	none	motivated	The hypothesis is motivated by the theoretical background but does not have a clear logical or causal relationship with any specific theory.
Study074	bumper plates would show increases in total work, which will also cause an increase in time under load	NA	none	consistent	The hypothesis is based on anecdotal evidence and practical observations rather than a specific theoretical framework.
Study074	the increased moment of inertia of the bumper could reduce the lifter's ability to make small adjustments to force production during the lift	NA	none	consistent	The hypothesis is based on general knowledge of inertia and its effects rather than a specific theoretical framework.
Study074	would therefore cause an increase in muscle activation and an increase in the joint moments at the shoulder, elbow, and wrist	NA	none	consistent	The hypothesis is based on general biomechanical principles and practical observations rather than a specific theoretical framework.
Study075	music would rearrange the brain's electrical frequency	NA	none	motivated	The hypothesis is motivated by the potential of music to influence brain activity but lacks explicit theoretical grounding.
Study075	increase the use of task-irrelevant thoughts (e.g., focusing outwardly towards external influences)	NA	none	motivated	The hypothesis is motivated by the potential of music to distract from internal cues but lacks explicit theoretical grounding.

Study075	induce more positive affective responses	NA	none	motivated	The hypothesis is motivated by the potential of music to improve mood but lacks explicit theoretical grounding.
Study075	enhance enjoyment to a greater degree when compared to other auditory conditions that are devoid of musical components (i.e., a podcast)	NA	none	motivated	The hypothesis is motivated by the potential of music to increase enjoyment but lacks explicit theoretical grounding.
Study076	a more negative touchdown distance (i.e., landing with the stance foot further behind/less far in front of the CM) would be associated with a greater ratio of forces during the ...	NA	none	consistent	The hypothesis is consistent with previous empirical findings but does not derive directly from a specific theory.
Study076	a more negative touchdown distance would be associated with greater initial acceleration performance	NA	none	consistent	The hypothesis is consistent with previous empirical findings but does not derive directly from a specific theory.
Study077	stroboscopic eyewear applied during warm-up on the sport-specific reaction speed in table tennis athletes should provide stronger performance gains after the warm-up when compar...	NA	none	motivated	The hypothesis is motivated by the observed effects in untrained participants and speculation about attention levels, but there is no explicit theoretical gr...
Study078	a low relative load (60% 1RM) and a high velocity loss (30%) would result in an increased RE 2000 time trial than a high relative load (80% 1RM) and a low velocity loss (10%)	NA	none	motivated	The hypothesis is motivated by empirical observations and practical experience rather than a theoretical prediction.
Study078	a decrement in A line, more predominant in v 0 than in L 0, would be expected after the most fatiguing protocols (VBT 60-30 1 RE 2000 . VBT 80-30 1 RE 2000 . VBT 60-10 1 RE 2000...	NA	none	motivated	The hypothesis is motivated by empirical observations and practical experience rather than a theoretical prediction.
Study079	less available time would imply higher mental fatigue	Psychobiological Model Of Mental Fatigue, Ego-depletion, Entropy	consistent	consistent	The hypothesis is consistent with the psychobiological model of mental fatigue and ego-depletion theory.
Study079	less available time would imply higher internal (Hypothesis 2a) and external (Hypothesis 2b) physical load than soccer scenarios with more available time	NA	none	motivated	The hypothesis is motivated by the need to test the effects of time constraints on physical load, but there is no explicit theoretical grounding.
Study080	3D MOT training will lead to positive effects in near (i.e., measures of attention) and far-transfer (i.e., decision-making).	3d Mot Training Theory	consistent	consistent	The hypothesis is consistent with the 3D MOT theory, which claims that training in this domain can improve attention and decision-making.
Study081	higher MTPJ stiffness would lead to increased jump height and take-off velocity.	NA	none	motivated	The hypothesis is motivated by empirical observations and practical experience rather than a theoretical prediction.
Study081	MTPJ stiffness would relate more to MTPJ variables than other proximal joint variables.	NA	none	motivated	The hypothesis is motivated by empirical observations and practical experience rather than a theoretical prediction.
Study082	intrinsic and extrinsic foot muscles would be damaged by full marathon running	NA	none	consistent	The hypothesis is based on the observed effects of marathon running on muscle damage and is not explicitly linked to a theory.

Study082	this damage would be more prominent in the intrinsic foot muscle damages than in extrinsic muscles	NA	none	consistent	The hypothesis is based on the assumed primary role of intrinsic muscles in supporting the foot arch and is not explicitly linked to a theory.
Study083	sprint performance and anteroposterior propulsive forces would decrease post-fatigue	NA	none	consistent	The hypothesis is not explicitly linked to any theory and is stated as a general prediction based on observed effects of fatigue.
Study084	after the 12-week retraining program: (1) the majority of runners who were accustomed to RFS would transition to FFS; (2) the morphological properties (length and CSA) of AT wou...	NA	none	motivated	The hypotheses are based on practical observations and empirical findings rather than a specific theoretical framework.
Study085	an interaction would be present between shoe and limb conditions.	NA	none	motivated	The hypothesis is motivated by the need to understand the interaction between shoes and limbs but lacks a theoretical grounding.
Study085	the DL in the MC shoe would have smaller sagittal plane knee joint angles and moments and larger frontal plane knee joint angles and moments than the NDL in the LT shoe.	NA	none	motivated	The hypothesis is motivated by the need to understand the interaction between shoes and limbs but lacks a theoretical grounding.
Study085	smaller sagittal plane and frontal plane ankle mechanics and greater vertical and posterior directed GRF would be observed when landing while wearing the MC.	NA	none	motivated	The hypothesis is motivated by the need to understand the interaction between shoes and ankle mechanics but lacks a theoretical grounding.
Study085	all GRF would remain similar between limbs.	NA	none	motivated	The hypothesis is motivated by the need to understand the interaction between shoes and GRF but lacks a theoretical grounding.
Study086	Recovery time variation during sprint interval training impacts amateur soccer players' adaptations.	NA	none	motivated	The hypothesis is motivated by practical experience and the need to optimize training adaptations, but there is no explicit or implicit theoretical grounding.
Study087	A single, submaximal prolonged run would increase PTA and reduce FMS scores in novice runners.	NA	none	motivated	The hypothesis is motivated by the observed effects of prolonged running on PTA and FMS scores, but no explicit theoretical grounding is provided.
Study087	3 weeks of progressively increasing running volume would increase PTA and reduce FMS scores compared with those before and after the submaximal prolonged run at baseline testing.	NA	none	motivated	The hypothesis is motivated by the observed effects of prolonged running on PTA and FMS scores, but no explicit theoretical grounding is provided.
Study087	A greater total running volume would be associated with larger increases in PTA and larger reductions in FMS scores after training in novice runners.	NA	none	motivated	The hypothesis is motivated by the observed effects of prolonged running on PTA and FMS scores, but no explicit theoretical grounding is provided.
Study088	decreased perceived effort would disproportionately correlate with throwing metrics (elbow stress and ball velocity)	NA	none	motivated	The hypothesis is motivated by practical observations and prior empirical findings rather than a theoretical prediction.
Study088	intrathrower reliability would be acceptable	NA	none	motivated	The hypothesis is motivated by practical observations and prior empirical findings rather than a theoretical prediction.

Study089	peak insole force and CWPF would decrease with increased step rate	NA	none	motivated	The hypothesis is motivated by empirical findings and practical observations, not a specific theoretical prediction.
Study089	peak axial sacral acceleration would decrease with increased step rate	NA	none	motivated	The hypothesis is motivated by empirical findings and practical observations, not a specific theoretical prediction.
Study089	peak axial sacral acceleration multiplied by body mass would correlate with peak insole force on cohort and individual levels	NA	none	motivated	The hypothesis is motivated by empirical findings and practical observations, not a specific theoretical prediction.
Study090	IMT would improve the MIP of elite swimmers, accelerating the lactate removal rate, and, therefore, improving swimming aerobic performance.	NA	none	motivated	The hypothesis is motivated by the background information on IMT and its potential benefits but lacks explicit theoretical grounding.
Study091	full ROM resistance training would immediately increase joint ROM and decrease muscle stiffness	Mechanical Properties Of Muscles And Joints	consistent	consistent	This hypothesis is consistent with the theory as it aligns with the expected outcome based on previous studies and the general understanding of muscle mechan...
Study091	stretch tolerance is related to increased joint ROM	NA	none	motivated	This hypothesis is motivated by previous studies but lacks a clear theoretical grounding. The theory mentioned (Kawama et al., 2022) does not provide a direc...
Study092	the higher cuff pressure would elicit the greatest change in EMG AMP as well as NIRS-derived parameters such as oxygenated hemoglobin (oxy[heme]) and deoxygenated hemoglobin (de...	NA	none	motivated	The hypothesis is motivated by previous reports but lacks explicit theoretical grounding.
Study092	the men would exhibit the greatest change in MAP, NIRS parameters, and EMG AMP	NA	none	motivated	The hypothesis is motivated by previous reports but lacks explicit theoretical grounding.
Study092	the women would report the greatest RPE	NA	none	motivated	The hypothesis is motivated by previous reports but lacks explicit theoretical grounding.
Study093	high-ranked adolescent table tennis players would show superior ankle proprioceptive performance to lower-ranked players and age-matched non-athletic controls	NA	none	motivated	The hypothesis is motivated by the assumption that sport-specific training may make different contributions to proprioceptive development at different age st...
Study093	ankle proprioception would be correlated with ball-hitting performance, and years of training	NA	none	motivated	The hypothesis is motivated by the assumption that ankle proprioception may be crucial to understanding proprioceptive function in table tennis, but there is...
Study093	in the dual-task condition, high-ranked adolescent table tennis players would show less ankle proprioceptive performance decline than lower-ranked players	NA	none	motivated	The hypothesis is motivated by the assumption that dual-task interference can be gradually attenuated with sport-specific training, but there is no explicit ...
Study094	a distal external focus would result in higher accuracy scores as well as increased functional variability compared to a more proximal or internal focus	NA	none	motivated	The hypothesis is motivated by the assumption that an external focus increases functional variability and recent evidence suggesting skilled performers

					are m...
Study095	The NGF, GDNF, and COX-2 mRNA levels would increase after the first exercise bout, but the magnitude of increases would be smaller after the second than the first bout of the on...	NA	none	motivated	The hypothesis is motivated by previous findings on the repeated bout effect (RBE) and the upregulation of NGF, GDNF, and COX-2 in animal models. However, it...
Study096	Improving strength levels through resistance training can enhance sprint, COD and jump performance in female soccer players.	NA	none	motivated	The hypothesis is motivated by the general belief in strength training's benefits but lacks explicit theoretical grounding.
Study097	local muscle stiffness would correlate with the respective joint ROM	NA	none	motivated	The hypothesis is motivated by empirical observations and the need to understand the relationship between muscle stiffness and ROM, but there is no explicit ...
Study098	athletes applying the common osoto-gari defence reaction display higher knee joint loadings accompanied with reduced muscle excitation levels in the musculature encompassing and...	NA	none	motivated	The theory provides the context but does not logically entail the specific prediction.
Study099	the choice condition would enhance learning as measured by a delayed retention test	OPTIMAL theory	consistent	consistent	The hypothesis is consistent with the OPTIMAL theory, which posits that autonomy support enhances performance and learning.
Study099	choice group participants would perceive more choice	NA	none	motivated	The hypothesis is motivated by the expectation that participants would perceive more choice, but there is no explicit theoretical grounding.
Study099	choice group participants would show greater confidence after practice	OPTIMAL theory	consistent	consistent	The hypothesis is consistent with the OPTIMAL theory, which suggests that autonomy support can enhance performers' expectancies and confidence.
Study099	choice group participants would show greater positive affect than the control group at the end of practice	NA	none	motivated	The hypothesis is motivated by the expectation that autonomy support would lead to greater positive affect, but there is no explicit theoretical grounding.
Study100	increased pitching distance would result in increased upper extremity kinetics	null	none	motivated	The hypothesis is motivated by the previous study but lacks a clear theoretical grounding.
Study100	increased pitching distance would result in some changes in full-body kinematics	null	none	motivated	The hypothesis is motivated by the previous study but lacks a clear theoretical grounding.
Study100	ball velocity would not be significantly affected by pitching distance	null	none	motivated	The hypothesis is motivated by the previous study but lacks a clear theoretical grounding.
Study100	as pitching distance increased, duration of ball flight, horizontal break, and vertical break would increase	null	none	motivated	The hypothesis is motivated by the previous study but lacks a clear theoretical grounding.
Study100	the percentage of strikes thrown would decrease as pitching distance increased	null	none	motivated	The hypothesis is motivated by the previous study but lacks a clear theoretical grounding.
Study101	a 30-min response inhibition cognitive task would induce MF and impair peak	NA	none	motivated	The hypothesis is motivated by the purpose to determine the effect of

	and mean time of the directional component but not the linear component of RSA.				cognitive task on RSA performance, but there is no explicit theoretical grounding.
Study101	MF would not affect peak height during isolated CMJs (measured at baseline and after each experimental treatment) and the RJA.	NA	none	motivated	The hypothesis is motivated by the purpose to determine the effect of cognitive task on RSA performance, but there is no explicit theoretical grounding.
Study101	MF would impair mean height and fatigue index (measured as decrement score) during the RJA.	NA	none	motivated	The hypothesis is motivated by the purpose to determine the effect of cognitive task on RSA performance, but there is no explicit theoretical grounding.
Study101	reaction times during the PVT would be slower following 30 min of a mentally fatiguing task compared to watching neutral videos, and slowest following the serial combination of ...	NA	none	motivated	The hypothesis is motivated by the purpose to determine the effect of cognitive task on PVT performance, but there is no explicit theoretical grounding.
Study102	women would run with lower magnitudes of ankle and knee extensor torques and positive power and work, but with greater hip joint torques and positive power and work compared to men	NA	none	motivated	The hypothesis is motivated by the observed gender differences in running mechanics but lacks a theoretical grounding.
Study103	such outcome would occur only when the higher pressures were applied (50% AOP, 80% AOP)	NA	none	motivated	The hypothesis is motivated by practical considerations and the need to include a placebo group, rather than being derived from or consistent with any specif...
Study105	athletes who were returning to play within 60 days after SRC would demonstrate altered LE biomechanics compared with the healthy control group during a jump-landing task	NA	none	motivated	The hypothesis is motivated by the observed increased risk of LE injuries after concussion, but no explicit theoretical grounding is provided.
Study106	after the sensor-based gait retraining, runners would demonstrate a footstrike pattern transition from RFS to non-RFS in all running conditions	NA	none	motivated	The hypothesis is motivated by the observed effect of gait retraining on footstrike pattern but lacks explicit theoretical grounding.
Study106	we expected a reduction in the VILR, accompanied with a decrease in stride length and an increase in running cadence and Knee-Flex IC	NA	none	motivated	The hypothesis is motivated by previous studies but lacks explicit theoretical grounding.
Study107	This duration and dosage of omega-3 PUFA will result in significant incorporation of EPA and DHA into erythrocytes membranes and increase O3I to values considered as a target ra...	NA	none	motivated	The hypothesis is motivated by the need for further work in this area, but there is no explicit or implicit theoretical grounding.
Study107	This will increase VO2peak and improve running economy (RE) to a degree that will translate into better running performance.	NA	none	motivated	The hypothesis is motivated by the positive effects of omega-3 PUFA on exercise performance, but there is no explicit or implicit theoretical grounding.
Study108	In winner shots, athletes will display longer QE compared to forced errors and unforced errors.	NA	none	motivated	The hypothesis is motivated by the expectation that qualitatively superior shots require more extended parametrization, but there is no explicit theoretical ...
Study108	In forced errors, athletes will display longer QE compared to unforced errors.	NA	none	motivated	The hypothesis is motivated by the expectation that forced errors are more

					complex and require more extended parametrization, but there is no explicit theore...
Study108	In winners, as opposed to unforced errors, athletes will extend their QE durations more in the HD match compared to the LD match.	NA	none	motivated	The hypothesis is motivated by the expectation that higher complexity tasks require more extended parametrization, but there is no explicit theoretical groun...
Study108	In winners, as opposed to forced errors, athletes will extend their QE durations more in the HD match compared to the LD match.	NA	none	motivated	The hypothesis is motivated by the expectation that higher complexity tasks require more extended parametrization, but there is no explicit theoretical groun...
Study109	A 10% increase in step rate would result in significant reductions in frontal-plane hip and pelvis kinematics and improvements in clinical outcomes and that these changes would ...	NA	none	motivated	The hypothesis is motivated by the need for a practical gait retraining method but lacks explicit theoretical grounding.
Study110	patients with CAI would show less force steadiness and accuracy in all 3 muscle groups compared with healthy control participants	NA	none	motivated	The hypothesis is motivated by the observed deficits in force sense and proprioception in patients with CAI, but there is no explicit theoretical grounding.
Study111	rugby players would have greater muscle volume due to long-term training and competition	NA	none	motivated	The hypothesis is motivated by the context of long-term training and competition, but there is no explicit theoretical grounding.
Study111	rugby players would have longer BFlh fascicle length due to the potentially larger muscle size	NA	none	motivated	The hypothesis is motivated by the context of muscle size, but there is no explicit theoretical grounding.
Study111	rugby players would have higher BFlh passive stiffness due to the potentially higher muscle volume	NA	none	motivated	The hypothesis is motivated by the context of muscle volume, but there is no explicit theoretical grounding.
Study111	rugby players would have lower BFlh fascicle length/KE, BFlh/KE and KF/KE muscle volume ratios due to potentially higher KE activities compared with healthy controls	NA	none	motivated	The hypothesis is motivated by the context of KE activities, but there is no explicit theoretical grounding.
Study112	The UT-MVIC would produce greater excitation in the UTR than would the MT-MVIC and LT-MVIC.	NA	none	motivated	The hypothesis is motivated by the practical need to assess each trapezius region separately, but there is no theoretical grounding provided.
Study113	RPE 5 2 would result in greater TTF than RPE 5 8	NA	none	motivated	The hypothesis is motivated by the purpose of the study but lacks a theoretical foundation.
Study113	MVIC would decrease from pretest to posttest with no difference between RPE 5 2 and RPE 5 8	NA	none	motivated	The hypothesis is motivated by the purpose of the study but lacks a theoretical foundation.
Study113	EMG AMP would decrease from pretest to posttest with no difference between RPE 5 2 and RPE 5 8	NA	none	motivated	The hypothesis is motivated by the purpose of the study but lacks a theoretical foundation.
Study113	EMG MPF would not change from pretest to posttest MVIC for either RPE 5 2 or RPE 5 8	NA	none	motivated	The hypothesis is motivated by the purpose of the study but lacks a theoretical foundation.
Study114	dirt and gravel would produce lower tibial accelerations than running over a paved	NA	none	consistent	The hypothesis is based on the practical observation that softer surfaces may

	surface				reduce loading forces, but there is no explicit theoretical grounding.
Study114	dirt and gravel would produce greater shock attenuation than running over a paved surface	NA	none	consistent	The hypothesis is based on the practical observation that softer surfaces may reduce loading forces, but there is no explicit theoretical grounding.
Study114	dirt and gravel would produce no differences in tibial accelerations or shock attenuations between dirt and gravel running surfaces	NA	none	consistent	The hypothesis is based on the practical observation that different surfaces may have similar effects, but there is no explicit theoretical grounding.
Study115	4v4-SSG format results in more actions, more different action types, more creative actions and more different creative action types compared to regular 11v11 matches.	NA	none	motivated	The hypothesis is motivated by the ecological approach and constraints-led perspective, but does not logically follow from these theories. The theory provide...
Study116	MI and RI would both improve anxiety and affect, compared with a control condition.	NA	none	consistent	The hypothesis is based on empirical findings and general aims without a clear theoretical grounding.
Study116	RI would elicit greater theta power (i.e., more cognitive control) than MI.	NA	none	consistent	The hypothesis is based on previous findings and general aims without a clear theoretical grounding.
Study116	When compared with control condition, both MI and RI would elicit greater alpha power.	NA	none	consistent	The hypothesis is based on previous findings and general aims without a clear theoretical grounding.
Study117	listening to research-selected music prior to a visual reaction time task would increase affective responses (i.e., feeling status and arousal state) and thus reduce RT.	NA	none	motivated	The hypothesis is motivated by the observed effects of music on affective responses and RT, but there is no explicit theoretical grounding.
Study118	individualized BFR training combined with traditional rehabilitation training would produce better recovery (measured by patient-rated wrist evaluation (PRWE) score, grip streng...	NA	none	motivated	The hypothesis is motivated by the observed need for individualized training approaches and the potential benefits of BFR, but there is no explicit theoretic...
Study119	the C&J would induce PAPE in both UL and LL performance	NA	none	motivated	The hypothesis is motivated by practical experience and empirical justification, not grounded in a specific theory.
Study119	PAPE would be greater using 7-and 12-minute intervals than with 4-minute intervals	NA	none	motivated	The hypothesis is motivated by practical experience and empirical justification, not grounded in a specific theory.
Study120	the gluteus medius and gluteus maximus would show more activation during SHA-anterior rolling than during SHA-neutral or SHA-posterior rolling	NA	none	motivated	The hypothesis is motivated by the need to address the weakness of gluteus medius and maximize activation in participants with such weakness, but there is no...
Study120	the tensor fasciae latae would show less activation during SHA-anterior rolling than during SHA-neutral or SHA-posterior rolling	NA	none	motivated	The hypothesis is motivated by the need to reduce tensor fasciae latae dominance, but there is no explicit theoretical grounding.
Study121	drafting will result in a greater decrease in physical and especially perceived intensity for each position after the leading skater.	NA	none	motivated	The hypothesis is motivated by empirical observations of drafting benefits but lacks a theoretical grounding.
Study122	the DAO would reduce the tibial	NA	none	motivated	The hypothesis is motivated by the design

	compressive force and allow greater sagittal ankle excursion compared with the walking boot.				of the DAO, which aims to offload the foot and ankle while retaining natural motion. No explicit theoretical ground...
Study123	these athletes would have significantly greater ACL CSAs in the leg that is loaded the most in comparison with the contralateral control leg.	NA	none	motivated	The hypothesis is motivated by the potential for exercise to increase ACL CSA but lacks a theoretical grounding.
Study123	we predicted a significant negative correlation between the bilateral difference in the ACL CSA and age of training onset.	NA	none	motivated	The hypothesis is motivated by the proposed relationship between training age and ACL CSA but lacks a theoretical grounding.
Study123	these muscle groups would produce significantly greater peak torques in the athletes' leg that is loaded the most in comparison with the other leg.	NA	none	motivated	The hypothesis is motivated by the potential for asymmetric loading to affect muscle strength but lacks a theoretical grounding.
Study123	the patellar tendon diameter would be significantly greater in the athletes' leg that is loaded the most in comparison with the other leg.	NA	none	motivated	The hypothesis is motivated by the potential for asymmetric loading to affect tendon diameter but lacks a theoretical grounding.
Study124	an 8-week hamstring flexibility intervention would significantly increase the range of hip joint flexion and hamstring optimal lengths, but not hamstring strength for both males...	NA	none	motivated	The hypothesis is motivated by practical experience in flexibility interventions but lacks explicit theoretical grounding.
Study124	an 8-week hamstring strength intervention would significantly increase hamstring strength and optimal lengths, but not the range of hip joint flexion for both males and females	NA	none	motivated	The hypothesis is motivated by practical experience in strength interventions but lacks explicit theoretical grounding.
Study125	isometric absolute PF and relative PF would demonstrate a moderate relationship with load-carrying performance	NA	none	motivated	The hypothesis is motivated by the practical need to find alternative methods for assessing strength, but there is no explicit or implicit theoretical ground...
Study125	a strong relationship between isometric force-time characteristics and SLJ performance would be observed	NA	none	motivated	The hypothesis is motivated by the practical need to find alternative methods for assessing strength, but there is no explicit or implicit theoretical ground...
Study126	those with upper extremity pain would show reduced energy flow into the proximal pelvis and trunk and reduced energy flow out of the distal pelvis and trunk during the accelerat...	NA	none	motivated	The hypothesis is motivated by the observed compensatory mechanisms and injury patterns in pitchers, but there is no explicit theoretical grounding.
Study127	the SSB will require a larger MEE from the knee NJT and a smaller MEE from the ankle and hip NJT compared with the TB	NA	none	motivated	The theory provides a framing for the expected outcome but does not logically entail it.
Study127	a lower load lifted (and total MEE) and a more upright posture with the SSB, which will result from a smaller hip MFA, peak hip NJT, and ankle NJT compared with the TB	NA	none	motivated	The theory provides a framing for the expected outcome but does not logically entail it.
Study128	pitchers who sustain a chronic upper extremity injury would have less lumbopelvic control before their injury, compared with a group of pitchers who do	NA	none	motivated	The hypothesis is motivated by empirical findings linking lumbopelvic control to injury risk, but no specific theoretical framework is cited.

	not sustain an injury				
Study129	participants with CAI would have alterations in both energy dissipation and generation by the ankle, knee, and hip joints during maximal jump landing and cutting	NA	none	motivated	The hypothesis is motivated by the observed altered movement patterns and reduced ROM in participants with CAI, but no explicit theoretical grounding is prov...
Study129	copers would have similar energy dissipation and generation by the ankle, knee, and hip joints when compared with controls	NA	none	motivated	The hypothesis is motivated by the observed differences in movement patterns between CAI and control groups, but no explicit theoretical grounding is provided.
Study131	the training session with a time limitation solving the task goals would increase mental load of players, reflected by larger pupil diameters, longer saccadic latencies, higher ...	NA	none	motivated	The hypothesis is motivated by the observed effects of time constraints on cognitive load in previous studies, but there is no explicit theoretical grounding.
Study132	concentric and eccentric peak power would be greater in the assisted compared with unassisted flywheel squat	NA	none	motivated	The hypothesis is motivated by practical experience and the need to increase peak power, but there is no theoretical grounding.
Study132	assisted squats would have lesser reliability than the unassisted flywheel squat	NA	none	motivated	The hypothesis is motivated by the complexity of assisted squats, but there is no theoretical grounding.
Study132	eccentric peak power correlates positively with concentric peak power	NA	none	motivated	The hypothesis is motivated by the logical association between concentric and eccentric outputs, but there is no theoretical grounding.
Study133	mental fatigue would impair players' endurance capacity	NA	none	consistent	The hypothesis is consistent with the general effects of mental fatigue on cognitive and physical performance, but no specific theory is cited.
Study133	mental fatigue would impair players' agility	NA	none	consistent	The hypothesis is consistent with the general effects of mental fatigue on cognitive and physical performance, but no specific theory is cited.
Study133	mental fatigue would impair players' sprinting ability	NA	none	consistent	The hypothesis is consistent with the general effects of mental fatigue on cognitive and physical performance, but no specific theory is cited.
Study133	mental fatigue would impair players' AF-specific technical skills	NA	none	consistent	The hypothesis is consistent with the general effects of mental fatigue on cognitive and physical performance, but no specific theory is cited.
Study134	men would exhibit larger CSAs and thicknesses in the absolute values but not in the normalized values	Sex Differences In Muscle Characteristics	explicit	consistent	The hypothesis is based on previous studies of sex differences in US-based muscle size, which are consistent with the theory.
Study134	no sex differences would be identified in US-based SWE stiffness of the cervical muscles	Sex Differences In Muscle Characteristics	explicit	consistent	The hypothesis is based on a previous study of sex differences in US-based SWE muscle stiffness, which are consistent with the theory.
Study135	heading test would report significant differences in kinetic and spatiotemporal	NA	none	motivated	The hypothesis is motivated by the need to improve specificity in jump tests for

	data such as: higher horizontal velocity of the center of mass, shorter ground contact time, and ...				soccer players, but there is no explicit theoretical grounding.
Study135	possible inter-subject variations in jumping technique (one-leg versus double legs) during the heading test could increase pelvic rotation in landing phase.	NA	none	motivated	The hypothesis is motivated by the need to understand differences in jumping techniques but lacks explicit theoretical grounding.
Study136	Following a single session of SMR NFT, professional golfers would demonstrate better putting performance, including a higher probability success rate and lower mean absolute err...	NA	none	motivated	The hypothesis is motivated by the practical application of EEG-NFT but lacks a clear theoretical grounding.
Study136	Following a single session of SMR NFT, professional golfers would exhibit higher SMR power during motor preparation for a putting task than in the CON condition.	Sensorimotor Rhythm (SMR) Activity	explicit	consistent	The hypothesis is consistent with the SMR activity theory, which suggests higher SMR power during motor preparation.
Study136	Following a single session of SMR NFT, professional golfers would exhibit improved scores on some of the psychological measures associated with SMR functionality (i.e., lower at...	NA	none	motivated	The hypothesis is motivated by the practical application of EEG-NFT but lacks a clear theoretical grounding.
Study137	there would be a direct correlation between PCT and soft tissue GIRD in the dominant arm	Davis's Law	consistent	consistent	Davis's Law predicts that the posterior capsule will hypertrophy with increased loading, which is consistent with the hypothesis of a direct correlation betw...
Study137	no relationship between PCT and soft tissue GIRD in the nondominant arm	NA	none	motivated	The hypothesis is motivated by the lack of expected soft tissue adaptations in the nondominant arm, but there is no theoretical grounding.
Study137	a strong positive relationship between soft tissue GIRD and the bilateral difference in PCT (posterior capsule hypertrophy [PCH])	NA	none	motivated	The hypothesis is motivated by the expected relationship between PCT and GIRD but lacks theoretical grounding.
Study138	ECs and ADCs would be more effective than ICs and neutral control cues, and that ADCs would be more effective than ECs, at enhancing vertical jump and 20 m sprint performance in...	NA	none	motivated	The hypothesis is motivated by previous literature but lacks a clear theoretical grounding.
Study139	fascicle behavior would differ by both contraction mode and intensity	NA	none	motivated	The hypothesis is motivated by the need to understand fascicle behaviors under different conditions but lacks a clear theoretical grounding.
Study139	fascicle behavior would be muscle length dependent	NA	none	motivated	The hypothesis is motivated by the understanding that muscle length can influence fascicle behaviors but lacks a clear theoretical grounding.
Study140	There would be differences in EMG amplitude, as well as in ratios between the exercises.	NA	none	none	The hypothesis is stated without any theoretical grounding or logical connection to a theory.
Study141	repeated IPC would attenuate the markers of EIMD during recovery in healthy recreational males to a greater extent than acute IPC and a control group	NA	none	motivated	The hypothesis is motivated by the observed benefits of repeated IPC in enhancing skeletal muscle adaptations and improving exercise performance, but there i...

Study142	cognitive effort with auditive distractor throughout prolonged endurance sessions impairs inhibitory control, MOT skill, HRV, and increases subjective mental fatigue until 24-h ...	NA	none	motivated	The hypothesis is motivated by the observed effects of prolonged cognitive effort and auditory distractors on physiological and cognitive measures, but there...
Study143	Factors related to explosive strength and maximal power would be more affected by a demanding field exercise than maximal strength.	NA	none	motivated	The hypothesis is motivated by previous observations but lacks a clear theoretical grounding.
Study143	These changes would be related to more pronounced impairments in type II fibers compared with type I fibers.	Muscle Damage And Recovery Mechanisms	explicit	consistent	The hypothesis is consistent with the theory that high activity can lead to muscle damage, particularly in type II fibers.
Study143	Changes in calcium-handling proteins are involved in this etiology.	Calcium Handling And Dynamics	explicit	consistent	The hypothesis is consistent with the theory that calcium handling proteins are involved in muscle function and fatigue resistance.
Study143	Impairments in explosive strength and power together with the muscle cellular outcomes were expected to recover faster in women than men.	NA	none	motivated	The hypothesis is motivated by previous observations but lacks a clear theoretical grounding.
Study144	energy cost would be reduced, and leg stiffness increased, in the super shoes at two individual-based running paces	NA	none	motivated	The hypothesis is motivated by previous research findings but does not have a clear theoretical grounding.
Study145	hamstring would develop less neuromuscular fatigue than quadriceps muscles	NA	none	motivated	The hypothesis is motivated by the greater proportion of fatigue-resistant Type I muscle fibers in hamstrings, but no explicit theoretical grounding is provi...
Study145	recovery from fatiguing exercise would be slower, and W′ and critical torque (in absolute) would be lower, in hamstring compared with quadriceps	NA	none	motivated	The hypothesis is motivated by the expected lower fatigability of hamstrings, but no explicit theoretical grounding is provided.
Study146	the average %V̇O 2peak during a cycling time trial (TT) is higher with acute hypoxia than near sea level	NA	none	consistent	The hypothesis is compatible with the observed disproportionate reduction in V̇O 2peak and performance with hypoxia, but it does not strictly follow from any ...
Study148	MVC torque and central mechanisms contributing to voluntary activation of the elbow flexors would be reduced due to the contraction protocol, and this reduction would be exacerb...	NA	none	motivated	The hypothesis is motivated by the observed effects of hypoxia on voluntary activation but lacks a clear theoretical grounding.
Study148	Voluntary activation of the elbow flexors would begin to recover rapidly after the sustained submaximal contraction, although recovery of voluntary activation would be delayed u...	NA	none	motivated	The hypothesis is motivated by the observed effects of hypoxia on voluntary activation but lacks a clear theoretical grounding.
Study149	the boundaries of the moderate-intensity (i.e., GET), heavy-intensity (i.e., .GET-CP and RCP), and severe-intensity (i.e., V̇O2max) domains and W9 would be reduced after 90 km of...	NA	none	consistent	The hypothesis is based on practical observations and prior findings, but no explicit theoretical grounding is provided.
Study150	the time course of muscle-and neural-related variables would demonstrate	NA	none	motivated	The hypothesis is motivated by the need to investigate different behaviors of

	different behavior in magnitude of change, in the course of successive conditioning contractions				muscle and neural variables, but there is no explicit or implicit theoretical g...
Study151	high-volume EB-RET would elicit significant and equivalent increases in iMyoPS rates and intracellular regulatory signaling responses in YM and OM.	NA	none	motivated	The hypothesis is motivated by the need to assess the acute molecular and metabolic response to EB-RET but lacks explicit theoretical grounding.
Study152	patients with PFP would exhibit additional reductions in all quadriceps neuromuscular function as exercise sets progressed	NA	none	motivated	The hypothesis is motivated by the observed neuromuscular dysfunction in PFP patients but lacks explicit theoretical grounding.
Study152	patients with PFP would display lower fatigue levels with worse muscular endurance performance during and after isokinetic exercise compared with the control group	NA	none	motivated	The hypothesis is motivated by the observed neuromuscular dysfunction in PFP patients but lacks explicit theoretical grounding.
Study153	crow hop throws would generate lower torque on the elbow than standing throws at each distance of the interval throwing program	NA	none	motivated	The hypothesis is motivated by practical experience and standard practice in UCL rehabilitation, but there is no explicit theoretical grounding.
Study154	the 50%v dec training group would improve sprint acceleration performance and underlying mechanical variables, more than a traditional RSS training with a light load or without ...	NA	none	motivated	There is no explicit or implicit theory linking the hypothesis to any of the identified theories.
Study155	These 3 cryotherapy modalities would decrease muscle damage in middle-and long-distance runners at different times.	NA	none	consistent	The hypothesis is based on the general understanding that cryotherapy can reduce muscle damage, but no specific theory is cited.
Study155	WBC would be more beneficial for decreasing muscle damage in middle-and long-distance runners.	NA	none	consistent	The hypothesis is based on the general understanding that WBC might be more effective, but no specific theory is cited.
Study156	academy players would present with significantly greater total daily energy expenditure than non-academy players	NA	none	consistent	The hypothesis is based on the observed higher training demands and growth-related energy requirements of academy players, but there is no explicit theoretic...
Study157	Nordic walking in water would exert a variety of beneficial impacts on physical fitness, glycemic control, vascular function, cerebrovascular reactivity (CVR), and cognitive imp...	NA	none	motivated	The hypothesis is motivated by the observed benefits of water-based exercise and Nordic walking, but no specific theoretical framework is provided.
Study158	A higher CO and SV (expressed as %COmax and %SVmax) will occur in women versus men in response to interval exercise, due to their smaller heart size and lower blood volume which...	NA	none	motivated	The hypothesis is motivated by physiological differences between sexes but lacks explicit theoretical grounding.
Study158	There will be a lower COmax in response to low-volume sprint interval exercise (SIE) than in response to high-volume HIIE protocols, as shown in a prior study.	NA	none	motivated	The hypothesis is motivated by prior empirical findings and not directly derived from a theory.
Study159	differences in running performance will be present in the current investigation	NA	none	consistent	The hypothesis is based on previous research findings in similar sports, but no specific theoretical framework is cited.

Study160	depending on the type of stimulus (real fight or punchbag), there would be variation in the levels of the hormone indices studied	NA	none	motivated	The hypothesis is motivated by previous scientific reports but lacks a clear theoretical grounding.
Study161	higher exposure time to smartphone applications leads to higher impairment in passing decision-making in professional soccer athletes	NA	none	motivated	The hypothesis is motivated by practical observations and a theoretical link to mental fatigue, but there is no explicit or implicit theory that logically en...
Study162	national runners would show larger improvements in RE and short distance performance with similar spatiotemporal modifications, when running in shoes with increased LBS, compare...	NA	none	motivated	The hypothesis is motivated by observed differences in biomechanical responses to increased LBS between different runner calibers, but there is no explicit t...
Study164	the application of CWI at 108C but not 158C would reduce mVO2 postimmersion	NA	none	motivated	The hypothesis is motivated by the premise of CWI reducing tissue metabolism but lacks explicit theoretical grounding.
Study165	positional differences would exist in turning activity, with central midfielders performing the greatest turning frequency	NA	none	consistent	The hypothesis is based on previous research findings and practical observations, but no explicit theoretical grounding is provided.
Study166	both BEP and HRP would improve neuromuscular performance on the following day	NA	none	consistent	The hypothesis is based on empirical observations and practical experience, not a specific theoretical framework.
Study166	BEP would induce superior performance enhancements compared with HRP	NA	none	consistent	The hypothesis is based on empirical observations and practical experience, not a specific theoretical framework.
Study167	physiological and perceptive responses would be higher in 4 m × 4 m compared to other area sizes	NA	none	consistent	The hypothesis is based on previous observations and general physiological principles, but lacks explicit theoretical grounding.
Study167	lower responses would be attributed to groundwork in comparison to standing combat due to its high energetic demand	NA	none	consistent	The hypothesis is based on general physiological principles and previous observations, but lacks explicit theoretical grounding.
Study167	4 m × 4 m in standing combat would induce the largest responses	NA	none	consistent	The hypothesis is based on general physiological principles and previous observations, but lacks explicit theoretical grounding.
Study168	HIIT induces an acute reduction in squat, but not in bench press explosive strength.	NA	none	motivated	The hypothesis is motivated by previous data but lacks a theoretical grounding.
Study168	Acute concurrent HIIT and squat loading, as well as HIIT and bench press loading would lead to reductions in both squat and bench press explosive strength.	NA	none	motivated	The hypothesis is motivated by previous data but lacks a theoretical grounding.
Study168	The magnitude of reductions in explosive strength in women might be lower to that previously shown in men.	NA	none	motivated	The hypothesis is motivated by previous data but lacks a theoretical grounding.
Study169	all training groups will exhibit improvement in both preplanned and unexpected tests	NA	none	motivated	The hypothesis is motivated by the observed benefits of FT in various athletic performance tests, but there is no explicit theoretical grounding.

Study169	the group exposed to random, unexpected, and unanticipated conditions will achieve superior results, particularly during unexpected tests	NA	none	motivated	The hypothesis is motivated by the need to introduce more challenging training methods, but there is no explicit theoretical grounding.
Study170	PT using free weights would induce larger improvements on measures of physical fitness compared with PJT in pre-PHV male soccer players.	NA	none	motivated	The hypothesis is motivated by previous empirical findings and theoretical knowledge, but there is no explicit or implicit theoretical grounding.
Study171	level of fatigue is associated with ankle proprioception decline during running	Fatigue Theory	consistent	consistent	The hypothesis is consistent with the Fatigue Theory, which suggests that fatigue can lead to declines in proprioception.
Study171	compared to normal socks, GCSs can work to retain ankle proprioception during prolonged running	Compression Garment Theory	consistent	consistent	The hypothesis is consistent with the Compression Garment Theory, which suggests that GCSs can enhance proprioceptive information input and reduce fatigue.
Study172	asymmetry would not increase during the exercise	NA	none	consistent	The hypothesis is based on previous findings of lower limb asymmetry but lacks a theoretical grounding.
Study172	both asymmetry and performance would be greater in HP than in LP players	Goosey-Tolfrey et al. 2018	explicit	consistent	The hypothesis is directly attributed to the findings of Goosey-Tolfrey et al. 2018, but no specific mechanism is provided.
Study172	these variables would be greater in males than in females	NA	none	consistent	The hypothesis is based on general observations but lacks a theoretical grounding.
Study173	the combination of cycling with plyometrics would enhance jump performance compared to a control condition, but with a differing time-course of PAPE effects for highintensity vs...	Post-Activation Potentiation (PAP)	consistent	consistent	The hypothesis is consistent with the PAP theory, which suggests that muscle preloading can acutely increase muscular power and performance. However, it does...
Study174	reduced horizontal velocity and substantial, acute kinematic and kinetic adaptations would be observed with fatigue	NA	none	motivated	The hypothesis is motivated by the understanding that fatigue impairs muscle force generation capacity, but there is no explicit theoretical grounding.
Study175	the 8-week NMES training can improve muscle quantity and quality and single-joint performance	NA	none	motivated	The hypothesis is motivated by the observed effects of NMES training on muscle strength in previous studies but lacks a theoretical grounding.
Study175	the improvements in muscle quantity and quality correlate with that of the single-joint performance	NA	none	motivated	The hypothesis is motivated by the observed relationships between muscle quality and physical performance in previous studies but lacks a theoretical grounding.
Study176	The location of the resistance band would produce different muscle activations in different exercise phases (ascending, stationary, and descending) of the wall-slide exercise.	NA	none	motivated	The hypothesis is motivated by practical experience and the need to investigate variations in muscle activation, but there is no explicit theoretical grounding.
Study176	This difference in muscle activations would produce different muscle-activation ratios.	NA	none	motivated	Similar to the first hypothesis, this is motivated by the need to understand muscle-activation ratios but lacks theoretical grounding.

Study177	such a protocol would elicit and retain meaningful physiological, perceptual, and performance adaptations	NA	none	motivated	The hypothesis is motivated by the practical need to find an effective HA protocol for elite female athletes, but there is no explicit or implicit theoretica...
Study178	resistance-trained climbers would exhibit greater reductions in reaction times and increases in RFD and sEMG when exposed to a startle stimulus during a reaction time task.	NA	none	motivated	The hypothesis is motivated by the observed differences in strength between trained and untrained individuals, but there is no explicit theoretical grounding.
Study179	male referees would experience significantly greater physical demands compared to female referees	NA	none	consistent	The hypothesis is based on previous observations of sex differences in physical performance and fitness levels, but no specific theory is cited.
Study180	the decrease in SSC function after cycling negatively affects cardiorespiratory and biomechanical variables in subsequent running.	Stretch-Shortening Cycle (Ssc) Theory	explicit	consistent	The hypothesis directly follows from the Ssc Theory's core claims about the importance of SSC function for running performance.
Study181	leg press multi-joint exercise would induce greater muscle damage on the VL, and longer time course muscle performance recovery than the knee extension single-joint exercise	NA	none	motivated	The hypothesis is motivated by previous evidence but lacks explicit theoretical grounding.
Study182	offset loading would increase limb ground-reaction force (GRF) and muscle electromyography (EMG) in the side resisted by the heavier load	NA	none	consistent	The hypothesis is based on previous acute changes in prime mover muscle activity during offset loading, but there is no explicit theoretical grounding.
Study182	offset loading toward the nondominant limb (OS-ND) would produce more symmetrical ground-reaction force and electromyography than traditional (TDL) loading	NA	none	consistent	The hypothesis is based on the expectation of symmetry, but there is no explicit theoretical grounding.
Study183	local VT would modulate muscle oxygenation and aid in maintaining strength after EIMD.	Oxygen Availability Theory	explicit	consistent	The hypothesis is consistent with the Oxygen Availability Theory, which posits that improved blood flow and oxygenation can mitigate the effects of EIMD on m...
Study184	mitochondrial content would be increased to a greater extent after INT compared to work- and intensity-matched CONT training	NA	none	consistent	The hypothesis is not explicitly linked to any theory and is based on the observed differences in training responses.
Study185	the kinematics at foot contact, specifically at the hips, would be correlated with lead- and back-hip active range of motion (AROM).	NA	none	motivated	The hypothesis is motivated by the observed relationship between hip flexibility and pitching mechanics, but no explicit theoretical grounding is provided.
Study185	peak elbow-varus torque (EVT) and peak shoulder internal rotation (IR) torque would be correlated with lead-and back-hip AROM.	NA	none	motivated	The hypothesis is motivated by the observed relationship between hip flexibility and pitching mechanics, but no explicit theoretical grounding is provided.
Study186	IRS after resistance training may enhance recovery of neuromuscular performance	NA	none	motivated	The hypothesis is motivated by the observed benefits of IR for recovery but lacks a theoretical grounding.
Study186	IRS after resistance training may increase nocturnal HRV	NA	none	motivated	The hypothesis is motivated by the observed effects of IR on HRV but lacks a theoretical grounding.

Study186	IRS after resistance training may attenuate muscle soreness	NA	none	motivated	The hypothesis is motivated by the observed effects of IR on muscle soreness but lacks a theoretical grounding.
Study186	IRS after resistance training may reduce biomarkers of muscle damage	NA	none	motivated	The hypothesis is motivated by the observed effects of IR on muscle damage biomarkers but lacks a theoretical grounding.
Study187	diurnal napping would (i) improve technical game-related performance	NA	none	motivated	The hypothesis is motivated by the aim of the study but lacks a theoretical grounding.
Study187	diurnal napping would (ii) enhance physiological response of athletes during SSG situations	NA	none	motivated	The hypothesis is motivated by the aim of the study but lacks a theoretical grounding.
Study188	muscle strength-trained participants would demonstrate decreased hip adduction, knee valgus, and tibial internal rotation angles, as well as an increased knee flexion angle, H:Q...	NA	none	motivated	The hypothesis is motivated by the literature suggesting core stability may be beneficial for reducing ACL injury risk, but no explicit theoretical framework...
Study189	FR would accelerate the recovery of muscle and joint proprioception after EIMD and, thereby, improve neuromuscular function.	NA	none	motivated	The hypothesis is motivated by the observed benefits of foam rolling on recovery from EIMD but lacks a theoretical grounding.
Study190	mental fatigue would result in higher RPEs during the submaximal endurance leg extension task, and that these increased RPEs would be associated with an elevated central motor c...	NA	none	motivated	The theory provides the context for the research direction but does not logically entail the specific prediction.
Study191	SSSGs as a warm-up approach would induce greater improvements in physical fitness qualities than a TWU in soccer players.	NA	none	motivated	The hypothesis is motivated by practical considerations and recent developments in warm-up strategies, but there is no explicit theoretical grounding.
Study192	a sleep hygiene training course may improve the total sleep time and sleep quality of swimmers, especially those with a high level of sleepiness	NA	none	motivated	The hypothesis is motivated by the observed need for sleep improvement in athletes, particularly swimmers, and the proposed benefits of sleep hygiene strateg...
Study193	Following ACL injury and reconstruction individuals would demonstrate increased torque complexity in the involved limb compared to the uninvolved limb, and that torque complexit...	NA	none	motivated	The hypothesis is motivated by the observed changes in torque complexity after ACL injury and reconstruction, but there is no explicit theoretical grounding.
Study194	acute NO3-supplementation would enhance power output during CON and ECC contractions during a half-squat movement completed at various moment inertias, and that this effect woul...	NA	none	motivated	The hypothesis is motivated by the observed effects of NO3-supplementation on muscle contractile function but lacks a clear theoretical grounding.
Study195	Any significant changes to the joint position when loaded would be of a small effect	NA	none	motivated	The hypothesis is motivated by the practical consideration of minimal load magnitude, but there is no theoretical grounding.
Study195	Any significant changes to angular velocity would be classified as small or moderate	NA	none	motivated	The hypothesis is motivated by the practical consideration of minimal load magnitude, but there is no theoretical

					grounding.
Study196	walking speed becomes progressively slower in hypoxia compared to normoxia when perceptually regulated	NA	none	motivated	The hypothesis is motivated by practical experience and prior empirical findings, but no explicit theoretical grounding is provided.
Study196	similar adjustments in physiological and perceptual responses occur when walking at the perceptually regulated speed adopted in hypoxia in normoxia	NA	none	motivated	The hypothesis is motivated by practical experience and prior empirical findings, but no explicit theoretical grounding is provided.
Study197	a menthol mouth swill will benefit performance during rugby-specific conditioning	NA	none	motivated	The hypothesis is motivated by the perceived effect of menthol on thermal comfort and performance, but there is no explicit theoretical grounding.
Study197	menthol will attenuate the rise in TS	NA	none	motivated	The hypothesis is motivated by the known effect of menthol on thermal comfort, but there is no explicit theoretical grounding.
Study198	inter-limb asymmetries would increase after both the unilateral and bilateral fatigue protocols	NA	none	consistent	The hypothesis is based on empirical evidence suggesting that excessive inter-limb asymmetries can impair performance and increase the risk of injury, but th...
Study198	the unilateral fatigue protocol would induce a selective impairment in the performance of the exercised leg, while the bilateral fatigue protocol would indistinctly affect one l...	NA	none	consistent	The hypothesis is based on empirical observations and practical considerations, but lacks explicit theoretical grounding.
Study198	the unilateral CMJ would be more sensitive to detect the expected changes in inter-limb asymmetries than the bilateral CMJ	NA	none	consistent	The hypothesis is based on empirical evidence and practical considerations, but there is no explicit theoretical grounding.
Study198	the three CMJ-derived mechanical variables would present a comparable sensitivity to detect the changes in inter-limb asymmetries	NA	none	consistent	The hypothesis is based on empirical evidence and practical considerations, but there is no explicit theoretical grounding.
Study199	There will be differences in the F-V profile depending on the performance level of the climbers and depending on the sex with international men showing better results than women...	NA	none	motivated	The hypothesis is motivated by the observed differences in performance levels and sex, but there is no explicit theoretical grounding.
Study200	muscle function would recover faster and there would be less DOMS after exercise when ELJ was supplemented in comparison to the placebo condition	NA	none	motivated	The hypothesis is motivated by the potential antioxidant and androgenic effects of ELJ, but there is no explicit or implicit theoretical grounding.
Study201	PTA at foot strike would increase over the duration of a running-induced fatigue test in comparison with earlier in the run.	NA	none	motivated	The hypothesis is motivated by the observed changes in biomechanics with fatigue but lacks a direct theoretical grounding.
Study201	Performance in muscle function testing would be negatively correlated to the change in axial PTA with running-induced fatigue (i.e., better strength, power, and endurance would ...	NA	none	motivated	The hypothesis is motivated by the observed changes in biomechanics with fatigue but lacks a direct theoretical grounding.
Study202	sodium replacement would: (1) increase ad libitum fluid intake and net water	NA	none	motivated	The hypothesis is motivated by practical experience and the need to address

	balance during and postexercise				sodium loss, but there is no explicit theoretical grounding.
Study202	sodium replacement would: (2) increase postexercise plasma sodium ([Na+] plasma)	NA	none	motivated	The hypothesis is motivated by the need to address sodium loss, but there is no explicit theoretical grounding.
Study202	sodium replacement would: (3) increase postexercise plasma osmolality (P Osm)	NA	none	motivated	The hypothesis is motivated by the need to address sodium loss, but there is no explicit theoretical grounding.
Study202	sodium replacement would: (4) reduce heart rate (HR) and rectal temperature (T re), but not rating of perceived exertion (RPE) or thermal comfort rating (TCR) during exercise	NA	none	motivated	The hypothesis is motivated by the need to address sodium loss, but there is no explicit theoretical grounding.
Study202	sodium replacement would: (5) reduce postexercise urinary sodium excretion (U Na) following exercise with no sodium replacement	NA	none	motivated	The hypothesis is motivated by the need to address sodium loss, but there is no explicit theoretical grounding.
Study202	sodium replacement would not influence hydration status 24 hours postexercise	NA	none	motivated	The hypothesis is motivated by the need to address sodium loss, but there is no explicit theoretical grounding.
Study203	higher load RT would result in greater neuromuscular activation	NA	none	consistent	The hypothesis is consistent with the literature suggesting higher loads result in greater neuromuscular activation, but this relationship is not derived fro...
Study203	higher TUT would result in a greater Blood LAC response	NA	none	consistent	The hypothesis is consistent with the literature suggesting an increase in Blood LAC with higher TUT, but this relationship is not derived from a specific th...
Study204	a standardized dynamic warm-up period, including low-intensity, nonspecific exercises progressing to maximal specific exercises, would have greater beneficial effects on short-t...	NA	none	motivated	The hypothesis is motivated by the need to examine the effects of warm-up on performance in young athletes, but there is no explicit or implicit theoretical ...
Study205	the contribution of the lower limb segments and trunk would increase during the acceleration phase and in consequence, the contribution of the upper limbs would decrease	NA	none	motivated	The hypothesis is motivated by the need to understand the role of each segment in total body kinetic energy production, but there is no explicit theoretical ...
Study206	upper-and lower body strength, contractile power, and RFD would be positively correlated with CHS in the present population of highly skilled male golfers.	NA	none	consistent	The hypothesis is based on previous literature and empirical findings, but no explicit theoretical grounding is provided.
Study206	anthropometric characteristics (arm length, body height, body mass) and AROM would correlate positively with maximal CHS.	NA	none	consistent	The hypothesis is based on previous literature and empirical findings, but no explicit theoretical grounding is provided.
Study207	dispositional mindfulness will serve as a moderator (Hayes, 2017) and interact with visualized PETTLEP imagery in mid-range shooting performance and retention.	NA	none	motivated	The hypothesis is motivated by the combination of dispositional mindfulness and visualized PETTLEP imagery, but there is no explicit or implicit theoretical ...

Study207	internal PETTLEP imagery is more effective than external perspective on basketball mid-range shooting performance and retention.	NA	none	motivated	The hypothesis is motivated by the perspective aspect of PETTLEP imagery, but there is no explicit or implicit theoretical grounding.
Study207	high mindfulness participants will have better performance than low mindfulness participants on basketball mid-range shooting performance and retention.	NA	none	motivated	The hypothesis is motivated by the dispositional mindfulness concept, but there is no explicit or implicit theoretical grounding.
Study208	12 weeks of aerobic exercise would enhance working memory in MA-dependent patients, and that the effects of high-intensity exercise would be stronger than those of moderate-inte...	NA	none	motivated	The hypothesis is motivated by the observed cognitive benefits of exercise in other populations but lacks a specific theoretical grounding.
Study209	players with shoulder pain would exhibit greater glenohumeral elevation and horizontal-abduction angles	NA	none	motivated	The hypothesis is motivated by previous findings suggesting that shoulder injuries might affect joint angles, but there is no explicit theoretical grounding.
Study209	players with shoulder pain would exhibit insufficient scapular upward rotation and posterior tilt	NA	none	motivated	The hypothesis is motivated by previous findings suggesting that shoulder injuries might affect scapular movement, but there is no explicit theoretical groun...
Study209	players with shoulder pain would exhibit decreased lower trunk rotation and side flexion	NA	none	motivated	The hypothesis is motivated by previous findings suggesting that shoulder injuries might affect trunk movement, but there is no explicit theoretical grounding.
Study210	the Froude efficiency of unilateral forearm amputees will be lower than values reported for nondisabled swimmers	NA	none	motivated	The hypothesis is motivated by the observed limitations in unilateral forearm amputee swimmers' ability to produce propulsion and maintain velocity.
Study210	Froude efficiency will be lower for the residual limb than the unaffected limb	NA	none	motivated	The hypothesis is motivated by the observed decrease in effectiveness of the residual limb with increased swimming speed.
Study210	intracyclic velocity fluctuation of forearm amputees will differ from values reported for nondisabled swimmers	NA	none	motivated	The hypothesis is motivated by the observed greater ICVF CV in unilateral forearm amputee swimmers compared to nondisabled swimmers.
Study210	associations will exist between Froude efficiency, intracyclic velocity fluctuation, upper limb velocity, and swimming velocity in forearm amputees	NA	none	motivated	The hypothesis is motivated by the known relationships between these variables in nondisabled swimmers and the expectation that similar associations would ho...
Study211	easier success criteria will lead to enhanced perceived expectations of success during acquisition	NA	none	motivated	The hypothesis is motivated by the general idea that easier criteria should lead to higher expectations, but there is no explicit theoretical grounding.
Study211	easing the criteria will increase expectancies of success, and making the criteria more difficult will lower expectancies of success	NA	none	motivated	Similar to the first hypothesis, this is motivated by general reasoning rather than a specific theoretical framework.
Study211	task performance and learning will improve with increased expectations of success and will decline when expectations of success are low	NA	none	motivated	This hypothesis is motivated by the general expectation that higher expectations should lead to better performance, but lacks theoretical

					grounding.
Study211	like putting performance, club kinematics will be more optimized with increased expectations of success and less optimized when expectations of success are low	NA	none	motivated	This hypothesis is motivated by the general expectation that kinematics should reflect performance, but lacks theoretical grounding.
Study212	a morning squat-based priming exercise utilizing a CS configuration would lead to greater enhancements in neuromuscular performance six hours after the end of the session compar...	NA	none	motivated	The hypothesis is motivated by practical experience and the need to address fatigue accumulation, but there is no explicit theoretical grounding.
Study213	CAI patients would demonstrate decreased dynamic postural control in the SV condition compared to copers and controls, based on their increased reliance on visual input.	NA	none	motivated	The hypothesis is motivated by the observed increased visual reliance in CAI patients but lacks a direct theoretical grounding.
Study214	compared to regular soccer training, substituting parts of a standard soccer training regimen with RBRT would induce larger improvements in measures of physical fitness in youth...	NA	none	motivated	The hypothesis is motivated by the observed need for improved physical fitness in youth soccer players and the proposed benefits of RBRT, but there is no exp...
Study215	the study dependent variables will be influenced by the SSGs bout duration and participant number	NA	none	motivated	The hypothesis is empirically motivated based on practical observations and experience with SSGs.
Study216	HABD torque would decrease after a fatiguing run	NA	none	motivated	The hypothesis is motivated by the need to assess the effect of fatigue on HABD strength, but there is no explicit theoretical grounding.
Study216	Gait variables previously associated with lower extremity overuse injury would be negatively correlated with HABD torque	NA	none	motivated	The hypothesis is motivated by the need to evaluate correlations between HABD strength and gait mechanics, but there is no explicit theoretical grounding.
Study217	rowing ergometer performance would decline after completing high-fatigue RT protocols, while low-fatigue RT protocols would not cause systematic changes	NA	none	motivated	The hypothesis is motivated by the observed effects of muscle fatigue on performance but lacks explicit theoretical grounding.
Study217	lower-body RT protocols would have a greater negative impact on rowing performance compared with upper-body RT protocols	NA	none	motivated	The hypothesis is motivated by the observed greater impact of lower-body RT on rowing performance but lacks explicit theoretical grounding.
Study218	subjects would achieve greater 1RM scores under HBD conditions	NA	none	motivated	The hypothesis is motivated by the belief that the HBD may be an effective alternative to the squat, but there is no explicit theoretical grounding.
Study218	there would be no difference in kinematic and kinetic variables between the exercises across all load conditions	NA	none	motivated	The hypothesis is motivated by the need to analyze similarities between exercises but lacks explicit theoretical grounding.
Study219	MULTI protocol would induce higher responses in all the dependent variables assessed compared with the SINGLE.	NA	none	motivated	The hypothesis is motivated by practical observations and the higher volume load of MULTI exercises, but there is no explicit theoretical grounding.
Study220	PEBA midsole would have better RE than EVA midsole when both conditions are	NA	none	consistent	The hypothesis is based on empirical findings and practical observations, not a

	fresh				specific theory.
Study220	the PEBA midsole would suffer more wear after 450 km, which could negatively affect biomechanics and RE	NA	none	consistent	The hypothesis is based on empirical findings and practical observations, not a specific theory.
Study221	repeated rapid contractions mostly induced a decrement in the net neural drive with the consequence of lowering the early phase RFD (i.e., the first 50 ms of force production)	NA	none	motivated	The hypothesis is motivated by the understanding of motor unit recruitment and discharge rate, but there is no explicit theoretical prediction linking these ...
Study222	CAI patients would display altered reactive lower extremity joint kinematics (e.g., increased ankle inversion angular velocity and displacement) while copers would have protecti...	NA	none	motivated	The hypothesis is motivated by the observed differences in behavior between CAI patients and copers, but no specific theoretical framework is cited.
Study223	both intervention groups would improve ice skating speed, acceleration, and agility beyond any improvements displayed by the control group	NA	none	motivated	The hypothesis is motivated by the observed effects of resisted sprint training in overground sports, but there is no explicit theoretical grounding.
Study223	ice skating kinematics and kinetics would be altered by participation in either resisted sprint training intervention	NA	none	motivated	The hypothesis is motivated by the observed effects of resisted sprint training in overground sports, but there is no explicit theoretical grounding.
Study224	a greater magnitude (90% of 1 repetition maximum [RM]) of loading would yield more positive clinical (primary outcome; Victorian Institute of Sport Assessment-Patella questionna...	NA	none	motivated	The hypothesis is motivated by practical observations and clinical experience, rather than a direct logical derivation from any theory.
Study225	plyometric-based structured game active breaks would improve FMS competence	NA	none	motivated	The hypothesis is motivated by the need to improve fundamental movement skills but lacks explicit theoretical grounding.
Study225	plyometric-based structured game active breaks would improve muscular fitness parameters	NA	none	motivated	The hypothesis is motivated by the need to improve muscular fitness but lacks explicit theoretical grounding.
Study225	plyometric-based structured game active breaks would improve student self-perception	NA	none	motivated	The hypothesis is motivated by the need to improve student self-perception but lacks explicit theoretical grounding.
Study225	plyometric-based structured game active breaks would improve student's actual behaviour	NA	none	motivated	The hypothesis is motivated by the need to improve student behaviour but lacks explicit theoretical grounding.
Study226	runners with larger tendons would exhibit increased flight time and reduced contact time due to their presumably improved capacity for storing and releasing greater elastic energy	NA	none	motivated	The hypothesis is motivated by the stretch-shortening cycle and biomechanical models of tendon function, but there is no explicit or implicit theoretical gro...
Study227	NHE training would result in improved performance in all the dependent variables	NA	none	motivated	The hypothesis is motivated by the known benefits of NHE but lacks a theoretical grounding.
Study227	The 1-day format would be just as effective as the 2-day format	NA	none	motivated	The hypothesis is motivated by the need for time-efficient training but lacks a theoretical grounding.
Study228	both subjective MF and PF would be increased post-match, comparative to pre	NA	none	consistent	The hypothesis is based on the general understanding of fatigue but lacks explicit

					theoretical grounding.
Study228	MF and PF would emerge as separate perceptual constructs	NA	none	consistent	The hypothesis is based on the general understanding of fatigue but lacks explicit theoretical grounding.
Study229	KT can reduce ankle plantarflexion angle and increase ankle dorsiflexion and eversion angles and moments compared with NT and PT.	NA	none	motivated	The hypothesis is motivated by the belief that KT can provide stability and support, but there is no explicit theoretical grounding.
Study230	combining NO3-and NAC supplementation before 1 h of cycling in the heavy-intensity domain would elevate preexercise plasma [CYS] and [GSH] while reducing the oxidative stress bi...	NA	none	motivated	The hypothesis is motivated by the rationale provided in the introduction, but there is no explicit or implicit theoretical grounding.
Study230	combining NO3-and NAC supplementation before 1 h of cycling in the heavy-intensity domain would attenuate the expected decline in neuromuscular function to a greater extent than...	NA	none	motivated	The hypothesis is motivated by the rationale provided in the introduction, but there is no explicit or implicit theoretical grounding.
Study230	combining NO3-and NAC supplementation before 1 h of cycling in the heavy-intensity domain would improve TTE to a greater extent than ingestion of NO3- or NAC alone	NA	none	motivated	The hypothesis is motivated by the rationale provided in the introduction, but there is no explicit or implicit theoretical grounding.
Study231	post BET would enhance physical and cognitive performance in both single and multitasking conditions compared with standard physical training alone.	NA	none	motivated	The hypothesis is motivated by the practical application of BET but lacks a clear theoretical grounding.
Study232	a prior MVIC would result in improved power clean performance across all contrast sets	NA	none	motivated	The hypothesis is motivated by the need to investigate PAPE but lacks a theoretical grounding.
Study233	hamstrings stiffness would be positively associated with eccentric hamstrings strength	NA	none	motivated	The hypothesis is motivated by the researcher's understanding of muscle function but lacks explicit theoretical grounding.
Study233	both greater eccentric hamstrings strength and stiffness would be associated with landing profiles consistent with less ACL loading	NA	none	motivated	The hypothesis is motivated by the researcher's understanding of ACL injury mechanisms but lacks explicit theoretical grounding.
Study234	an optimum support foot position would generate higher ball speed and accuracy during football instep kicking	NA	none	motivated	The hypothesis is motivated by practical experience and the need to improve kicking performance, rather than a specific theoretical prediction.
Study235	short bouts of tensional loading, initiated 2 weeks after the injury, would lead to a tendon callus with higher elastic modulus	NA	none	consistent	The hypothesis is based on animal studies and clinical observations, but no explicit theoretical framework is cited.
Study235	early loading would increase patient satisfaction and reduce muscle atrophy	NA	none	consistent	The hypothesis is based on the general understanding that early functional rehabilitation can improve patient outcomes, but no explicit theoretical framework...
Study236	The NP shoes would allow people to run with less knee flexion and smaller peak	NA	none	motivated	The hypothesis is motivated by previous studies on cushioning but lacks a direct

	knee moments.				theoretical grounding.
Study236	The peak ankle extensor moment would be greater in the NP shoes.	Mechanical Advantage Theory	consistent	consistent	The hypothesis is consistent with the Mechanical Advantage Theory, which suggests that increased stiffness in the shoe midsole can alter joint mechanics.
Study236	Dorsiflexion and negative work at the MTP joint would be less in the NP shoes.	Joint Gear Ratio Theory	consistent	consistent	The hypothesis is consistent with Joint Gear Ratio Theory, which posits that increased gear ratio can reduce joint work.
Study237	There would be significant interleg differences in knee biomechanics during side-cutting of the individuals with ACLR.	NA	none	motivated	The hypothesis is motivated by previous studies observing altered biomechanics in the reconstructed leg but not explicitly grounded in a theory.
Study237	The contralateral leg would also have altered knee biomechanics and there would be significant differences between individuals with ACLR and healthy controls.	NA	none	motivated	The hypothesis is motivated by the observed differences in the reconstructed leg and the similarity in injury rates between legs, but not explicitly grounded...
Study237	The reconstructed leg would have significant strength deficits in the quadriceps and hamstring compared with the contralateral and healthy control legs.	NA	none	motivated	The hypothesis is motivated by previous studies showing lower strength in the reconstructed leg but not explicitly grounded in a theory.
Study238	high-intensity strength training (85% 1-repetition maximum) would increase CSE and reduce SICI	NA	none	motivated	The hypothesis is motivated by previous experiments but lacks a clear theoretical grounding.
Study238	low-intensity strength training (<30% 1-RM) would increase CSE and have no effect on SICI	NA	none	motivated	The hypothesis is motivated by previous experiments but lacks a clear theoretical grounding.
Study239	precooling would enhance subsequent performance in a similar fashion that mid-cooling would improve subsequent performance	NA	none	motivated	The hypothesis is motivated by the aim of the study but lacks a theoretical grounding.
Study240	The supplementation protocol adopted would maximize both strength and morphological adaptations induced by the RT programme.	NA	none	motivated	The hypothesis is a general aim without a specific theoretical prediction.
Study241	all BT programs would result in balance and muscle power improvements in prepubertal children	NA	none	motivated	The hypothesis is motivated by the existing evidence but lacks a theoretical grounding.
Study241	children would benefit more from dynamic BT (high task difficulty)	Task Difficulty	explicit	consistent	The hypothesis is consistent with the Task Difficulty theory, which suggests that varying task difficulty can lead to different training adaptations.
Study242	the mean F M-L would increase in the curve, with a concomitant decrease in the mean F V and F A-P, and the F TOT in the curve would remain similar to the straight	NA	none	consistent	The hypothesis is based on empirical observations and previous studies, but no explicit theoretical framework is cited.
Study242	because of the reduced mean F V in the curve, the stance times would increase to produce a IMP V similar to the straight	NA	none	consistent	The hypothesis is based on empirical observations and previous studies, but no explicit theoretical framework is cited.
Study243	dynamic hip ROM would improve after hip arthroscopy	NA	none	motivated	The hypothesis is motivated by the clinical evidence of improved patient-

					reported outcomes after hip arthroscopy, but there is no explicit theoretical ground...
Study243	hip dynamic ROM would be associated with changes in PRO scores at both 6 months and 1 year	NA	none	motivated	The hypothesis is motivated by the clinical evidence of improved PRO scores after hip arthroscopy, but there is no explicit theoretical grounding.
Study244	acute fasting would negatively influence performance and increase subjective perceptions of hunger and satiety proportionally to the fasting time	NA	none	motivated	The hypothesis is motivated by practical observations and prior empirical findings, rather than a theoretical prediction.
Study245	the posterior peroneus longus compartment would present a lower EMG amplitude in the CAI group compared to No-CAI group	NA	none	consistent	The hypothesis is based on observed differences in muscle activation patterns and the known anatomical contributions of different compartments to ankle evers...
Study246	U23 ELITE cyclists demonstrate higher physiological, performance, as well as training and racing characteristics compared to U23 NON-ELITE.	NA	none	motivated	The hypothesis is motivated by the observed differences in race success and training characteristics between different age categories, but no specific theory...
Study247	the ETM would decrease TTE and increase dyspnea, EMG di, P di, and respiratory muscle fatigue compared to control exercise	NA	none	motivated	The hypothesis is motivated by the potential physiological effects of the ETM but lacks a clear theoretical grounding.
Study248	RSE training would be equivalently effective at improving RHIEa, with larger improvements for repeated sprints with RSE training	NA	none	motivated	The hypothesis is motivated by the need to compare RSE and RHIE training methods but lacks a theoretical grounding.
Study248	RHIE training would more strongly improve repeated contact effort performance	NA	none	motivated	The hypothesis is motivated by the need to compare RSE and RHIE training methods but lacks a theoretical grounding.
Study248	Both training programs would produce similar improvements in game situations in terms of high-intensity running and contact efforts production	NA	none	motivated	The hypothesis is motivated by the need to compare RSE and RHIE training methods but lacks a theoretical grounding.
Study249	combined high-intensity static stretching and high-speed dynamic stretching decreases the MTU stiffness and increases muscle strength of the hamstrings	NA	none	motivated	The hypothesis is motivated by previous studies but lacks a clear theoretical grounding.
Study250	both training load and environmental conditions would influence sweat rate and sodium loss	NA	none	consistent	The hypothesis is stated without a theoretical grounding and is based on the observed variability in sweat loss among players under different conditions.
Study251	the adaptive ankle brace would restrict movement less during slower, nonexcessive ankle motions	NA	none	motivated	The hypothesis is motivated by practical experience and the need to optimize comfort without compromising protection.
Study251	a similar protective effect of the adaptive brace to those of the passive braces during sudden inversion motions	Central Governor Model	consistent	consistent	The Central Governor Model suggests that the body has a protective mechanism during sudden motions, which is consistent with both adaptive and passive braces...
Study251	an improved sports performance and subjective comfort rating of athletes using the adaptive compared with the passive	NA	none	motivated	The hypothesis is motivated by the need to balance protection with comfort and performance, without a direct theoretical

	ankle braces				grounding.
Study252	higher shoulder-abduction angles would lead to increased activation of all parts of the trapezius and increased UT/MT and UT/LT activation ratios during scapular-retraction exer...	NA	none	motivated	The hypothesis is motivated by practical observations and the need to enhance trapezius activation patterns, but there is no explicit theoretical grounding.
Study253	WG/S decrease wrist joint moment, joint angles, total joint ROM arc, and GRF in back handsprings.	NA	none	motivated	The hypothesis is motivated by the practical recommendation of using WG/S to prevent wrist injuries, but there is no explicit theoretical grounding.
Study254	peak M s, peak M a, peak M k, and peak M h would increase with load but not depth	NA	none	motivated	The hypothesis is motivated by the need to understand how load affects joint moments but lacks a theoretical grounding.
Study254	percent contribution of the ankle would decrease with depth but increase with load	NA	none	motivated	The hypothesis is motivated by the need to understand how depth and load affect joint contributions but lacks a theoretical grounding.
Study254	percent contribution of the knee would increase with depth but not load	NA	none	motivated	The hypothesis is motivated by the need to understand how depth and load affect joint contributions but lacks a theoretical grounding.
Study254	percent contribution of the hip would increase with both depth and load	NA	none	motivated	The hypothesis is motivated by the need to understand how depth and load affect joint contributions but lacks a theoretical grounding.
Study255	the effects of increased ROM and decreased tissue hardness would be greater in VFR compared to FR because the vibration function would affect mechanoreceptors	NA	none	consistent	The hypothesis is consistent with the understanding of how vibration affects mechanoreceptors but does not have a direct theoretical grounding.
Study256	lower movement velocities and higher force levels can be hypothesized during BPT when loads are increased during exercise (eg, 30%-70% of 1-RM).	NA	none	motivated	The hypothesis is motivated by the literature on force-velocity profile but lacks a direct theoretical grounding.
Study256	mechanical performance measures during BPT will be enhanced when using EXT compared with INT instructions at light and/or heavy loads but not at moderate loads.	NA	none	motivated	The hypothesis is motivated by the literature on attentional focus but lacks a direct theoretical grounding.
Study257	different wrist postures would result in varying strength levels in HGS max .	NA	none	motivated	The hypothesis is motivated by the observed effects of postural changes on muscle performance but lacks explicit theoretical grounding.
Study257	there would be a relationship between MEP amplitude and posture, whereby postures that generate muscle shortening would increase MEP amplitude.	NA	none	motivated	The hypothesis is motivated by previous findings on corticospinal modulation but lacks explicit theoretical grounding.
Study257	a corticospinal modulatory effect of the intrinsic hand muscle even if it has not modified its length.	NA	none	motivated	The hypothesis is motivated by the observed effects of postural changes on corticospinal modulation but lacks explicit theoretical grounding.
Study258	diurnal napping would change the HRV	NA	none	motivated	The hypothesis is motivated by the need

	profile of athletes following nap in order to prepare them for physical stress				to understand the role of napping on physiological health but lacks explicit theoretical grounding.
Study258	diurnal napping would impact positively perceived variables including stress, sleepiness and fatigue	NA	none	motivated	The hypothesis is motivated by the need to understand the role of napping on psychological health but lacks explicit theoretical grounding.
Study259	exercise in a hot, humid environment would produce greater functional-balance deficits than exercise in ambient temperatures and standing in the heat.	NA	none	consistent	The hypothesis is consistent with the understanding that heat stress impairs balance, but no specific theory is cited.
Study259	the 20-minute recovery protocol would not return rectal temperature and perceived exertion measures to baseline values.	NA	none	consistent	The hypothesis is consistent with previous findings but lacks a specific theoretical grounding.
Study260	the inhibited response, but not the simple response in both the cognitive and the motor tasks will be altered by the exercise	NA	none	motivated	The hypothesis is motivated by the literature on acute exercise and cognitive performance but lacks explicit theoretical grounding.
Study260	motor and cognitive inhibition will be related	NA	none	motivated	The hypothesis is motivated by the overlap in brain networks mediating cognitive and motor inhibition but lacks explicit theoretical grounding.
Study261	mechanical work done by lower limb joint moments would decline following the repeated running protocol, particularly at the hip.	NA	none	motivated	The hypothesis is motivated by previous studies observing phase fluctuations in kinetic and gravitational potential energies, but lacks a clear theoretical g...
Study261	the reduction in sprint speed following the repeated running protocol would be correlated with changes in work done by the hip moments.	NA	none	motivated	The hypothesis is motivated by previous studies suggesting the importance of hip moments in increasing running speed, but lacks a clear theoretical grounding.
Study262	the kinematics of a single-leg DVJ leg would differ between the dominant and nondominant legs	NA	none	motivated	The hypothesis is motivated by the observed differences in leg dominance and its potential impact on injury risk, but there is no explicit theoretical ground...
Study263	The sequence of plyometric and dynamic stretching exercises influences subsequent sprint performance.	NA	none	motivated	The hypothesis is motivated by practical experience and the need to optimize warm-up routines, but there is no explicit theoretical grounding.
Study264	The Americans would have a less elbow flexion at FC, greater shoulder ER at maximum ER, and faster ball velocity compared to the Japanese pitchers.	NA	none	consistent	The hypothesis is based on previous biomechanical studies and empirical observations, but no specific theory is cited.
Study264	American pitchers would have increased throwing arm kinetics compared to Japanese players associated with higher ball velocity.	NA	none	consistent	The hypothesis is based on previous biomechanical studies and empirical observations, but no specific theory is cited.
Study265	8 weeks of in-season RT in Division I NCAA football players in the LVHI exercise group would result in significant increases in lower-body strength, power, and acceleration, whe...	NA	none	motivated	The hypothesis is motivated by practical observation and the need to understand the impact of volume load differences on performance, without a clear theoret...
Study266	Prior cues would influence action	NA	none	motivated	The hypothesis is motivated by the

	anticipation.				general observation that prior information can influence behavior, but no specific theory is cited.
Study266	Expert goalkeepers would outperform novices on the cue-anticipation task because long-term sports training may improve the efficiency of information processing related to their ...	NA	none	motivated	The hypothesis is motivated by the general observation that expertise improves performance, but no specific theory is cited.
Study266	The amplitudes of both cue-locked and target-locked components would be influenced by prior cues.	NA	none	motivated	The hypothesis is motivated by the general observation that prior information influences neural activity, but no specific theory is cited.
Study267	those who used the spatial occlusion goggles during the training intervention would benefit through (i) a significant improvement in pass accuracy, reducing outcome error, (ii) ...	NA	none	motivated	The hypothesis is motivated by the practical need to improve performance in a complex task while maintaining or improving attentional control, but there is n...
Study268	a sustained isometric knee contraction would induce both pain unpleasantness and pain intensity	NA	none	motivated	The hypothesis is a general statement about the expected outcome of an experiment and not derived from or consistent with any specific theory.
Study268	active tDCS with the anodal electrode placed over the left DLPFC would reduce ratings of exercise-induced pain unpleasantness, but not pain intensity	NA	none	motivated	The hypothesis is a specific prediction based on practical experience and post-hoc theoretical framing.
Study268	active tDCS with the anodal electrode placed over the left DLPFC would enhance muscular endurance time when compared to a placebo control	NA	none	motivated	The hypothesis is a specific prediction based on practical experience and post-hoc theoretical framing.
Study269	sport-specific physical performance gains (repeated-sprint ability and on-field aerobic capacity) and vascular function adaptations will be larger after this innovative RSH prot...	NA	none	motivated	The hypothesis is motivated by the observed benefits of RSH in previous studies but lacks explicit theoretical grounding.
Study270	such an approach would improve maximum muscular strength, technique, and 100-m butterfly swimming performance in competitive age-group swimmers	NA	none	motivated	The hypothesis is motivated by the observed effects of MST and HIIT on swimming performance, but there is no explicit theoretical grounding.
Study271	the MF intervention would worsen players' game-based relevant performance responses such as physical enjoyment, total distance covered, and technical actions (e.g., lost balls a...	NA	none	motivated	The hypothesis is motivated by the observed effects of mental fatigue on performance in previous studies, but there is no explicit theoretical grounding.
Study272	the athlete group with poorer neurocognitive function would exhibit greater acceleration and rotational velocity following landing compared to the groups with higher neurocognit...	NA	none	motivated	The hypothesis is motivated by the observed relationship between poorer neurocognitive performance and increased injury risk, but no explicit theoretical gro...

5b: Inference Type

What this means. Inference type captures the *logical* relationship between a theory and a hypothesis — a distinction that linkage strength alone does not capture. **Derived** means the hypothesis follows deductively from the theory's core claims: you cannot hold the theory true and deny the hypothesis without contradiction. **Consistent** means the hypothesis is compatible with the theory but also compatible with other theories or no theory. **Abductive** means the hypothesis was arrived at through practical observation or prior empirical findings first, and a theoretical label was invoked post-hoc to provide mechanistic framing — legitimate scientific practice (Steele, 2024; Peirce), but epistemologically distinct from derivation. **Motivated** means the theory inspired the research but bears no logical or causal relationship to the specific prediction. Most applied research falls into the *consistent* or *abductive* categories — but both are evidentially much weaker than derivation, and their prevalence signals a systematic gap between theoretical claims and empirical practice in this literature.

Inference type — the logical relationship between theories and hypotheses across the sample

Inference type	Count	%	What this means
consistent	106	23%	Hypothesis compatible with theory, but also compatible with other theories or no theory
motivated	359	77%	Theory inspired research direction but bears no logical connection to the specific prediction
none	1	0%	No logical connection to any theory

5c: Mechanism Specification

What this means. A hypothesis specifies a mechanism when it explains *how* or *why* the effect will occur — not just *that* it will occur. Mechanism specification transforms a directional prediction into a test of a causal claim. Its absence means confirmation of the prediction does not distinguish between the theoretical mechanism and any alternative causal pathway producing the same directional result.

Mechanism specification — proportion of hypotheses that explain the causal pathway, not just the predicted direction

Mechanism specification	Count	%
Specified — introduction explains HOW or WHY the effect will occur	32	7%
Not specified — only THAT an effect will occur is stated	434	93%

Section 6: Discussion — Theory Re-engagement

Methods. The discussion section of each article was passed to the LLM alongside the list of theories identified in the introduction. The model was asked to assess: (1) whether the discussion re-engages with the theoretical framework when interpreting results; (2) whether results are interpreted in terms of the theory's broader predictions or only in terms of confirming or rejecting the specific hypothesis; and (3) whether the authors make claims that go beyond what their hypothesis test can support.

How to read this section. Re-engagement quality indicates the depth of theoretical reasoning at the interpretation stage. **Full** re-engagement means results are interpreted in terms of the theory and its broader implications. **Partial** means the theory is mentioned but results are only discussed at the hypothesis level. **Absent** means the theory named in the introduction is not referenced when interpreting results — the authors have abandoned their theoretical framework before interpreting their findings. **Overclaiming** refers to generalisations or conclusions that exceed what the hypothesis test can support.

Discussion analysis summary — theory re-engagement and overclaiming rates

Metric	Count	%
Full re-engagement — results interpreted in terms of the theory	12	5%
Partial re-engagement — theory mentioned but results discussed only at hypothesis level	241	95%
Absent re-engagement — theory not referenced in the discussion	0	0%
Articles where authors make claims beyond what their hypothesis test supports	4	2%
Discussion extraction failures	3	1%

Overall discussion quality rating

Discussion quality	Count	%	What this means
adequate	233	92%	Some theoretical interpretation, minor overclaiming
strong	9	4%	Theory re-engaged, results interpreted theoretically, claims proportionate
weak	11	4%	No theoretical re-engagement or substantial overclaiming

Discussion analysis — article-level detail

Article	Re-engagement	Quality	Evidence	Overclaim?	Overclaim detail
Study001	full	adequate	The authors interpret results in terms of the broader theoretical implications for cardiovascular adaptations, mechanical loading, and perceptual load, connecting these findings...	FALSE	NA
Study019	full	strong	The authors explicitly connect their findings back to the broader theoretical framework, discussing how differences in sensitivity between muscle and tendon to mechano-metabolic...	FALSE	NA
Study025	full	strong	The authors interpret the results in terms of the broader theoretical framework, discussing how different types of proteins affect myofibrillar and muscle connective protein syn...	FALSE	NA
Study029	full	strong	The authors interpret results in terms of the broader theoretical framework, specifically the intensity-duration relationship and sex differences in fatigability and recovery.	FALSE	NA
Study058	full	strong	The authors explicitly connect their findings back to the Gas Exchange Threshold (GET) and Critical Power theories, interpreting results in terms of the broader claims about dom...	FALSE	NA
Study076	full	strong	The authors explicitly connect the results back to the theoretical framework by discussing how the findings extend previous work and support specific mechanisms proposed by Jaco...	FALSE	NA

Study266	full	strong	The authors connect results back to Bayesian Statistics, Motor Simulation Theory, Action Anticipation Theory, and Expert Advantage Theory by discussing how the findings support ...	FALSE	NA
Study002	partial	adequate	The authors mention the Central Governor Model, but only discuss results in terms of specific hypotheses (e.g., formation and possession effects) rather than broader theoretical...	FALSE	NA
Study004	partial	adequate	The authors discuss how their findings relate to previous literature on ankle instability, but do not explicitly connect results back to a specific theoretical framework or broa...	FALSE	NA
Study006	partial	adequate	The discussion mentions the theory that endurance training is effective for weight loss and fat reduction, but primarily focuses on interpreting results at the hypothesis level ...	FALSE	NA
Study007	partial	adequate	The authors discuss the relationship between strength and various handball-specific fitness elements, but do not explicitly connect these results back to a broader theoretical f...	FALSE	NA
Study008	partial	adequate	The authors discuss how the results align with previous findings and suggest reasons for differences, but do not explicitly connect these to broader theoretical frameworks or me...	FALSE	NA
Study010	partial	adequate	The authors discuss how their findings align with previous studies but do not	FALSE	NA

			explicitly connect results back to the broader theoretical framework or specific predictions from t...		
Study011	partial	adequate	The authors mention theories related to post-exercise IC improvements and the role of lactate, blood glucose, and psychological parameters in cognitive function but do not expli...	FALSE	NA
Study012	partial	adequate	The authors discuss the results in terms of specific predictions related to tendon and muscle length changes but do not explicitly connect these findings back to a broader theor...	FALSE	NA
Study013	partial	adequate	The authors discuss the relative intensities and time to achieve target energy expenditure (EE) but do not explicitly connect these results back to a broader theoretical framework.	FALSE	NA
Study014	partial	adequate	The authors mention Cross-Education theory but primarily discuss the results in terms of specific findings (e.g., greater adaptations in children, ipsilateral vs. contralateral ...	FALSE	NA
Study015	partial	adequate	The authors discuss the broader implications of their findings on the Caloric balance and nutrient balance theories, but do not explicitly name or re-engage with specific theore...	FALSE	NA
Study016	partial	adequate	The authors mention theories related to bone health and performance but primarily discuss the results in terms of specific hypotheses rather than broader theoretical implications.	FALSE	NA
Study017	partial	adequate	The authors mention Self-Determination Theory, Central Governor Model, and Dual-Process Model but only discuss results in terms of specific hypotheses (e.g., CRF improvements) r...	FALSE	NA
Study018	partial	adequate	The authors discuss the results in terms of their specific hypothesis (improvement in sprint performance) but do not explicitly connect these findings to a broader theoretical f...	FALSE	NA
Study020	partial	adequate	The authors discuss how their findings relate to previous studies and provide practical applications but do not explicitly connect results back to a specific theoretical framework.	FALSE	NA
Study021	partial	adequate	The authors mention Self-Determination Theory, Central Governor Model, and Achievement Goal Theory but only discuss results at the hypothesis level without connecting them back ...	FALSE	NA
Study022	partial	adequate	The authors mention the Overreaching	FALSE	NA

			Model and Central Governor Model but primarily discuss their findings in terms of specific hypotheses rather than broader theoretical implic...		
Study023	partial	adequate	The authors discuss how their findings relate to previous research on set configurations, rest times, and muscle failure but do not explicitly connect these results back to a sp...	FALSE	NA
Study024	partial	adequate	The authors mention several studies and a systematic review that support the hypothesis, but do not explicitly connect their results back to these broader theoretical claims or ...	FALSE	NA
Study026	partial	adequate	The authors mention Sensorimotor Control Theory but only discuss results in terms of specific hypotheses (e.g., sensory reweighting impairments) rather than broader theoretical ...	FALSE	NA
Study027	partial	adequate	The discussion mentions the EIMD theory and HSP theory, but primarily focuses on confirming or denying specific hypotheses rather than interpreting results in terms of broader t...	FALSE	NA
Study028	partial	adequate	The authors mention several theories and mechanisms related to muscle and liver damage, caffeine, taurine, and blood pressure but do not explicitly connect these back to a speci...	FALSE	NA
Study030	partial	adequate	The authors mention the theory but only discuss results at the hypothesis level (increase in FATox and performance benefits), without considering broader theoretical implications.	FALSE	NA
Study032	partial	adequate	The authors discuss how their findings align with previous studies and suggest that muscles become more prone to damage after immobilization, but do not explicitly connect resul...	FALSE	NA
Study033	partial	adequate	The authors discuss how their findings relate to specific mechanisms of cardiac function but do not explicitly connect these results back to the broader theoretical frameworks i...	FALSE	NA
Study034	partial	adequate	The authors mention the Central Governor Model, Arthrogenic Muscle Response, and Pain-Induced Neuromuscular Adaptations but only discuss results in terms of specific hypotheses ...	FALSE	NA
Study035	partial	adequate	The authors discuss the results in terms of specific hypotheses (e.g., neuromuscular performance, RPE) but do not fully interpret these findings within a broader theoretical fra...	FALSE	NA

Study036	partial	adequate	The authors discuss how the results align with or differ from previous research on SSC function and maturity status but do not explicitly connect these findings back to the spec...	FALSE	NA
Study037	partial	adequate	The authors discuss the results in terms of specific hypotheses but do not explicitly connect them to broader theoretical frameworks such as Central Governor Model, Self-Determi...	FALSE	NA
Study038	partial	adequate	The authors mention the theories but focus on interpreting results at the hypothesis level, discussing the effects of AEL and RR on various kinetic and kinematic variables witho...	FALSE	NA
Study039	partial	adequate	The authors discuss the findings in terms of their specific hypotheses, but do not explicitly connect these results back to broader theoretical frameworks such as Central Govern...	FALSE	NA
Study040	partial	adequate	The authors discuss results in terms of specific hypotheses (e.g., carbohydrate intake would reduce protein degradation, maintain carbohydrate availability), but do not explicit...	FALSE	NA
Study041	partial	adequate	The authors discuss how the results align with previous findings on the effects of high-intensity exercise on subsequent performance, but do not explicitly connect these results...	FALSE	NA
Study042	partial	adequate	The authors discuss how their findings relate to specific mechanisms and variables within the theories (e.g., neuromuscular control, muscle synergies), but do not explicitly nam...	FALSE	NA
Study043	partial	adequate	The authors mention the theory in the introduction but only discuss results at the hypothesis level, without considering broader theoretical implications.	FALSE	NA
Study044	partial	adequate	The authors discuss some correlations between hip strength and pitching biomechanics but do not explicitly connect these results back to the broader theoretical frameworks of Bi...	FALSE	NA
Study045	partial	adequate	The authors discuss the results in terms of their specific hypothesis (effectiveness of the additional 12-week isometric neck strengthening program) but do not fully interpret t...	FALSE	NA
Study046	partial	adequate	The authors discuss the results in terms of specific predictions (e.g., U-shaped curves for physiological and perceptual responses), but do not explicitly connect these back to ...	FALSE	NA

Study047	partial	adequate	The authors mention Self-Determination Theory and Achievement Goal Theory but only discuss results in terms of specific hypotheses (e.g., improvements in vertical jump height fo...	FALSE	NA
Study048	partial	adequate	The authors discuss how their findings align with existing theories on muscle inhibition and facilitation mechanisms, but do not explicitly name or re-engage with a specific the...	FALSE	NA
Study049	partial	adequate	The authors mention the Dose-Response Model and Central Governor Model but only discuss their results at the level of specific hypotheses (e.g., differences in evoked torque, ob...	FALSE	NA
Study050	partial	adequate	The discussion primarily focuses on interpreting results in terms of specific hypotheses rather than broader theoretical implications.	FALSE	NA
Study051	partial	adequate	The authors discuss how their findings relate to previous studies on squat types and HTWD but do not explicitly connect the results back to a specific theoretical prediction or ...	FALSE	NA
Study052	partial	adequate	The authors mention the theory of differences in MMP between cyclists based on performance levels or team roles but only discuss results at the hypothesis level, focusing on abs...	FALSE	NA
Study053	partial	adequate	The authors discuss how their findings support the idea that both central and peripheral processes contribute to dynamic contractile performance, but do not explicitly connect t...	FALSE	NA
Study054	partial	adequate	The authors discuss the results in terms of specific physiological and perceptual outcomes but do not explicitly connect these back to broader theoretical frameworks or mechanisms.	FALSE	NA
Study055	partial	adequate	The authors mention previous research supporting the hypothesis that wetsuits reduce TI and drag, but they do not explicitly connect their results back to a broader theoretical ...	FALSE	NA
Study056	partial	adequate	The authors mention Flywheel Resistance Training and Force-Velocity Profile but only discuss results at the hypothesis level without connecting them back to broader theoretical ...	FALSE	NA
Study057	partial	adequate	The authors discuss how their findings relate to previous theories and mechanisms, such as the impact of hypoxia on performance and muscle oxygenation, but do not explicitly con...	FALSE	NA

Study059	partial	adequate	The authors mention the Bone Remodeling Theory and Biopsychosocial Model but primarily discuss the results in terms of specific hypotheses rather than broader theoretical implic...	FALSE	NA
Study060	partial	adequate	The authors discuss the results in terms of their hypotheses, but do not explicitly connect these back to a broader theoretical framework or consider what the findings mean for ...	FALSE	NA
Study061	partial	adequate	The authors mention altered intramuscular and intermuscular scapular balance ratios in hockey players but do not explicitly connect the results to a broader theoretical framewor...	FALSE	NA
Study062	partial	adequate	The authors mention Central Governor Model and Self-Determination Theory but only discuss the results at the hypothesis level, focusing on specific findings such as cardiorespir...	FALSE	NA
Study063	partial	adequate	The authors mention Self-Determination Theory (SDT) in interpreting some findings, such as the higher enjoyment and pleasure associated with autonomous HIIT, but do not fully en...	FALSE	NA
Study065	partial	adequate	The authors discuss how caffeine improved performance but do not explicitly connect this back to a broader theoretical framework or interpret results within that context.	FALSE	NA
Study066	partial	adequate	The authors mention previous studies but do not explicitly connect the results back to a specific theoretical prediction or broader theoretical framework.	FALSE	NA
Study067	partial	adequate	The authors mention Supercompensation Phenomena and Postactivation Performance Enhancement (Pape) but only discuss results at the hypothesis level, not considering broader theor...	FALSE	NA
Study068	partial	adequate	The authors mention the three-headed model and suggest that physiological resilience may complement it as a fourth parameter, but they do not explicitly connect their findings b...	FALSE	NA
Study070	partial	adequate	The authors mention previous studies on minimal and maximal shoes but do not fully interpret their results in terms of the broader theoretical framework.	FALSE	NA
Study071	partial	adequate	The discussion mentions the Central Governor Model and Self-Determination Theory in the introduction but does not explicitly connect the results back to these theories or their ...	FALSE	NA
Study072	partial	adequate	The authors mention Central Governor	FALSE	NA

			Model and Self-Determination Theory, but only in a general context without interpreting results through these frameworks. The discussion foc...		
Study073	partial	adequate	The authors discuss how results relate to cognitive style theory and structure mapping model in terms of performance changes and cognitive efficiency, but do not explicitly name...	FALSE	NA
Study074	partial	weak	The authors mention that their hypotheses were not supported but do not interpret these results in terms of a broader theoretical framework or specific predictions from any theory.	FALSE	NA
Study075	partial	adequate	The discussion mentions the Central Governor Model, Attentional Focus Theory, and Music And Arousal Theory but primarily focuses on interpreting results in terms of specific hyp...	FALSE	NA
Study077	partial	adequate	The authors mention previous studies supporting the positive effects of long-term stroboscopic training but do not fully interpret their results in terms of these broader theore...	FALSE	NA
Study078	partial	adequate	The authors mention the Central Governor Model and Dual-Process Model but only discuss results in terms of specific hypotheses (e.g., loading magnitude or velocity loss) rather ...	FALSE	NA
Study079	partial	adequate	The authors mention the Psychobiological Model Of Mental Fatigue but only discuss results at the hypothesis level, without considering broader theoretical implications.	FALSE	NA
Study080	partial	weak	The authors mention the 3d Mot Training Theory but only discuss results at the hypothesis level, failing to interpret them through the broader theoretical framework.	TRUE	The authors overclaim by generalizing their findings to all athletes and suggesting practical implications unsupported by the data, such as recommending VR-supported perceptual cognitive training for decision-making in soccer.
Study081	partial	adequate	The authors mention several theories related to biomechanics and jumping performance but primarily discuss their findings in terms of specific correlations rather than broader t...	FALSE	NA
Study082	partial	adequate	The authors mention the intrinsic and extrinsic muscle damage but do not explicitly connect these results to broader theoretical frameworks or mechanisms.	FALSE	NA
Study083	partial	adequate	The authors mention the Central Governor Model and discuss fatigue effects, but do not explicitly connect results to broader theoretical claims or mechanisms.	FALSE	NA
Study084	partial	adequate	The authors mention the Tendon Pathology	FALSE	NA

			Model, Biomechanical Adaptation To Footwear And Strike Pattern, and Progressive Loading Model For Tendon Adaptation in the introduction ...		
Study085	partial	adequate	The authors mention Self-Determination Theory and Biomechanical Models Of Landing Mechanics but only discuss results at the hypothesis level, not in terms of broader theoretical...	FALSE	NA
Study086	partial	weak	The authors mention previous studies but do not explicitly connect the results back to a broader theoretical framework or interpret them in terms of specific predictions from su...	FALSE	NA
Study087	partial	adequate	The authors mention the theory but only discuss results at the hypothesis level, focusing on whether a single submaximal prolonged run and a 3-week running program affected PTA ...	FALSE	NA
Study088	partial	adequate	The authors discuss their findings in terms of specific hypotheses but do not explicitly connect these results back to broader theoretical claims or mechanisms.	FALSE	NA
Study090	partial	adequate	The authors mention the Central Governor Model and Self-Determination Theory but only discuss results at the hypothesis level without broader theoretical implications.	FALSE	NA
Study091	partial	adequate	The discussion mentions Self-Determination Theory and Mechanical Properties Of Muscles And Joints, but primarily focuses on interpreting results in terms of specific hypotheses ...	FALSE	NA
Study092	partial	adequate	The authors mention theories such as Self-Determination Theory, Central Governor Model, Achievement Goal Theory, and Biopsychosocial Model but do not explicitly connect the resu...	FALSE	NA
Study093	partial	adequate	The authors mention the dual-process model and ecological validity, but primarily discuss results at a hypothesis level without connecting them to broader theoretical implications.	FALSE	NA
Study094	partial	adequate	The authors mention the Central Governor Model and Ecological Dynamics but only discuss results in terms of specific hypotheses (e.g., distal focus vs proximal or internal foci)...	FALSE	NA
Study095	partial	weak	The discussion mentions that NGF is a molecule responsible for DOMS but does not interpret results in terms of broader theoretical claims or mechanisms.	FALSE	NA
Study096	partial	adequate	The authors mention the theory of specificity but do not fully interpret results through this theoretical framework.	FALSE	NA

Study097	partial	adequate	The discussion mentions the relationship between muscle stiffness and joint ROM but does not explicitly connect these results back to a broader theoretical framework or consider...	FALSE	NA
Study098	partial	adequate	The authors mention biomechanical risk factors for ACL injuries but do not explicitly connect results back to broader theoretical claims or mechanisms.	FALSE	NA
Study099	partial	adequate	The authors discuss how the findings align with previous studies on choice and its impact on performance and confidence, but do not explicitly connect these results back to the ...	FALSE	NA
Study100	partial	adequate	The authors mention Self-Determination Theory but only discuss their specific hypotheses without connecting results to broader theoretical implications.	FALSE	NA
Study101	partial	adequate	The authors mention mental fatigue (Mf) but only discuss results at the hypothesis level, such as supporting or not supporting specific hypotheses related to repeated sprinting ...	FALSE	NA
Study102	partial	adequate	The authors discuss the results in terms of specific hypotheses (e.g., gender and age effects) but do not explicitly connect these back to a broader theoretical framework or exi...	FALSE	NA
Study103	partial	weak	The authors mention the initial hypothesis and its failure but do not interpret results in terms of a specific theoretical prediction or broader theory.	FALSE	NA
Study104	partial	weak	The discussion mentions previous research by Marzouki et al., but does not interpret the results in terms of a specific theoretical prediction or broader claims.	FALSE	NA
Study105	partial	adequate	The authors mention theories such as Perception-Action Coupling Loop and Biomechanical Analysis Of Jump-Landing Task but primarily discuss results in terms of specific hypothese...	FALSE	NA
Study106	partial	adequate	The authors mention Self-Determination Theory, Central Governor Model, and Achievement Goal Theory but only discuss the results at a hypothesis level without connecting them to ...	FALSE	NA
Study107	partial	adequate	The authors mention the theory but only discuss it at the hypothesis level, focusing on the specific findings related to O3I and VO2peak without broader theoretical implications.	FALSE	NA
Study108	partial	adequate	The authors mention the Information Processing Approach but only discuss results in terms of specific hypotheses (e.g.,	FALSE	NA

			QE's role in performance and dealing with complexity) rat...		
Study109	partial	adequate	The authors discuss how the results align with the theoretical framework of multifactorial causes of patellofemoral pain and self-determination theory, but do not explicitly nam...	FALSE	NA
Study110	partial	adequate	The authors mention the Central Governor Model, Sensorimotor System Theory, and Central Neuromuscular Control Theory but only discuss results at the hypothesis level without con...	FALSE	NA
Study111	partial	adequate	The authors mention the potential long-term adaptations of muscle structures to rugby-specific training but do not fully interpret results in terms of a broader theoretical fram...	FALSE	NA
Study112	partial	adequate	The authors discuss their findings in relation to previous studies but do not explicitly connect the results back to the specific theoretical predictions made.	FALSE	NA
Study113	partial	adequate	The authors mention the Unified Taxonomy Of Fatigue, Central Governor Model, and Neuromuscular Efficiency (NME) but only discuss their findings in terms of specific hypotheses r...	FALSE	NA
Study114	partial	adequate	The authors mention previous studies but do not explicitly connect their results back to a broader theoretical framework.	FALSE	NA
Study116	partial	adequate	The authors mention theories such as Mindfulness-Based Intervention (MBI) and Relaxation Techniques but primarily discuss the results in terms of hypothesis confirmation rather ...	FALSE	NA
Study117	partial	adequate	The authors mention the Central Governor Model, Dual-Process Model, and Achievement Goal Theory but only discuss results in terms of specific hypotheses rather than broader theo...	FALSE	NA
Study118	partial	adequate	The authors discuss the results in terms of specific mechanisms and outcomes related to BFR training (e.g., grip strength, ROM), but do not explicitly connect these findings bac...	FALSE	NA
Study119	partial	adequate	The authors mention that their findings agree with other studies involving CMJ but do not explicitly interpret results in terms of the broader theoretical framework or mechanisms.	FALSE	NA
Study120	partial	adequate	The authors interpret the results by explaining them through previous studies, but do not explicitly connect these findings back to a broader theoretical framework.	FALSE	NA
Study121	partial	adequate	The authors mention Central Governor	FALSE	NA

			Model and Self-Determination Theory but only discuss results in terms of specific hypotheses (e.g., physical and perceived intensity differe...		
Study122	partial	adequate	The authors discuss how the results support their hypotheses but do not explicitly connect these findings back to a broader theoretical framework or theory.	FALSE	NA
Study123	partial	adequate	The authors discuss the results in terms of their potential implications for ACL injury prevention and training, but do not explicitly connect them back to a specific theoretica...	FALSE	NA
Study124	partial	adequate	The authors discuss results in terms of specific predictions from Self-Determination Theory and the Biopsychosocial Model, but only at a hypothesis level ('partially support our...	FALSE	NA
Study125	partial	adequate	The authors mention theories related to strength and endurance but do not fully interpret results through these theoretical frameworks.	FALSE	NA
Study126	partial	adequate	The authors mention the hypothesis but primarily discuss the results at a more specific level (e.g., total amounts of inflow and outflow, peak rates), without fully interpreting...	FALSE	NA
Study127	partial	adequate	The authors mention the Static Stick Figure Model and compare their findings with predictions made by this model, but they do not fully interpret results in terms of broader the...	FALSE	NA
Study128	partial	adequate	The authors discuss how lumbopelvic control relates to pitching performance and injury risk, but do not explicitly connect results back to a broader theoretical framework such a...	FALSE	NA
Study129	partial	adequate	The authors mention the Central Governor Model indirectly through discussions of energy dissipation and generation, but do not explicitly connect results to broader theoretical ...	FALSE	NA
Study131	partial	adequate	The discussion mentions theories such as Constraints-Led Approach and Task Constraints but primarily focuses on interpreting results in terms of specific hypotheses rather than ...	FALSE	NA
Study132	partial	adequate	The authors mention Flywheel Training and Moment Of Inertia Effects On Kinetics And Kinematics but primarily discuss the results in terms of specific hypotheses rather than broa...	FALSE	NA
Study133	partial	adequate	The authors mention the theory of mental fatigue but primarily discuss results in	FALSE	NA

			terms of specific hypotheses rather than broader theoretical implications.		
Study134	partial	adequate	The authors mention some theories in the introduction (e.g., Normative Values, Biomechanical Properties Of Muscles) but only discuss their hypotheses and findings without connec...	FALSE	NA
Study135	partial	adequate	The authors discuss how biomechanical differences between run-up vertical jump and heading test can be explained by the presence or absence of a ball, but do not explicitly conn...	FALSE	NA
Study136	partial	adequate	The authors mention the psychomotor efficiency hypothesis but only discuss results at the level of specific hypotheses (Hypotheses 1, 2, and 3) without broader theoretical impli...	FALSE	NA
Study137	partial	adequate	The authors mention theories such as Davis's Law and Biomechanical Adaptations In Overhead Athletes but only discuss results in terms of specific hypotheses rather than broader ...	FALSE	NA
Study138	partial	adequate	The authors mention theories such as Constrained Action Hypothesis, Attentional Focus Theory, and Analogies In Coaching but only discuss results in terms of specific hypotheses ...	FALSE	NA
Study139	partial	adequate	The authors discuss how their findings relate to previous research on fascicle behavior but do not explicitly connect the results back to a specific theoretical framework from t...	FALSE	NA
Study141	partial	adequate	The authors mention Ischemia-Reperfusion Injury and Ischemic Conditioning (Ic) but only discuss results at the hypothesis level, focusing on MVIC recovery without connecting bac...	FALSE	NA
Study142	partial	adequate	The authors mention the Central Governor Model, Self-Determination Theory, and related concepts but primarily discuss results in terms of specific hypotheses rather than broader...	FALSE	NA
Study143	partial	adequate	The authors mention the Central Governor Model, Self-Determination Theory, Dual-Process Model, Muscle Damage And Recovery Mechanisms, and Calcium Handling And Dynamics but prima...	FALSE	NA
Study144	partial	adequate	The authors mention Running Economy and Leg Stiffness And Running Economy but only discuss the results in terms of specific hypotheses (e.g., energy cost reduction, leg stiffnes...	FALSE	NA
Study145	partial	adequate	The authors discuss the results in terms of specific mechanisms related to	FALSE	NA

			neuromuscular fatigue but do not explicitly connect these back to a broader theoretical framework such...		
Study146	partial	adequate	The authors discuss their findings in terms of the specific predictions made, such as the increase in %V̇O 2peak during a cycling TT at high altitude and the poorer cycling econo...	FALSE	NA
Study148	partial	adequate	The authors mention Central Governor Model and Self-Determination Theory but only discuss results in terms of specific hypotheses (e.g., effects on voluntary activation, cortico...	FALSE	NA
Study149	partial	adequate	The authors discuss how their findings relate to GET and V̇O2max but do not explicitly connect these results back to the Central Governor Model or Signal Detection Theory.	FALSE	NA
Study150	partial	adequate	The authors mention Postactivation Potentiation (PAP) but only discuss it in terms of specific hypotheses related to twitch torque, rather than interpreting the results through ...	FALSE	NA
Study151	partial	adequate	The authors discuss the results in terms of their implications for muscle anabolic signaling and iMyoPS but do not explicitly connect them to the specific theoretical prediction...	FALSE	NA
Study152	partial	adequate	The authors mention Arthrogenic Muscle Inhibition and Neuromuscular Fatigue but only discuss the results at a hypothesis level, not in terms of broader theoretical implications.	FALSE	NA
Study153	partial	adequate	The authors mention previous studies but do not explicitly connect their results back to the broader theoretical framework or mechanisms.	FALSE	NA
Study154	partial	adequate	The authors mention the Central Governor Model and Velocity-Power Relationship Theory but only discuss results at the hypothesis level, not considering broader theoretical impli...	FALSE	NA
Study155	partial	adequate	The authors mention the EIMD model criteria (CK values, VAS score) and how they align with previous research, but do not interpret results in terms of broader theoretical mechan...	FALSE	NA
Study156	partial	adequate	The authors mention the Dual-Process Model and Energy Balance And Nutrition theories in the introduction but only discuss results at the hypothesis level, not considering broade...	FALSE	NA
Study157	partial	adequate	The authors mention the theory of exercise benefits but primarily discuss the results at	FALSE	NA

			a hypothesis level without connecting them to broader theoretical implications.		
Study158	partial	adequate	The authors mention theories such as Fick Equation, Self-Determination Theory, and Central Governor Model but primarily discuss results in terms of specific hypotheses rather th...	FALSE	NA
Study159	partial	adequate	The authors discuss the differences in running performance between elite and sub-elite players but do not explicitly connect these results back to a broader theoretical framewor...	FALSE	NA
Study160	partial	adequate	The discussion mentions the expected changes in cortisol and testosterone levels based on exercise duration and intensity but does not interpret the results in terms of specific...	FALSE	NA
Study161	partial	adequate	The authors mention Ecological Dynamics, Multifactorial Model Of Sports Performance, and Mental Fatigue but only discuss their findings at the hypothesis level without broader t...	FALSE	NA
Study162	partial	weak	The authors mention previous studies and theories related to LBS and RE but do not explicitly connect their results back to a specific theoretical prediction from the introduction.	FALSE	NA
Study164	partial	adequate	The authors mention Central Governor Model and Self-Determination Theory but only discuss their results in terms of confirming or failing to confirm specific hypotheses rather t...	FALSE	NA
Study165	partial	adequate	The discussion mentions the Central Governor Model and Ecological Dynamics, but primarily focuses on the specific hypothesis related to turning demands in English Premier League...	FALSE	NA
Study166	partial	adequate	The authors discuss how BEP and HRP affect specific jump performances, but do not fully interpret these results in terms of a broader theoretical framework.	FALSE	NA
Study168	partial	adequate	The authors mention the Central Governor Model and discuss how HIIT affects explosive strength performance, but do not explicitly connect results back to broader theoretical cla...	FALSE	NA
Study169	partial	adequate	The authors mention the Central Governor Model and Taxonomic Framework Of Motor Control but only discuss results at the hypothesis level, focusing on specific performance metric...	FALSE	NA
Study170	partial	adequate	The authors discuss the results in terms of specific predictions related to physical fitness measures such as aerobic endurance,	FALSE	NA

			muscle strength, change of direction speed, and ...		
Study171	partial	adequate	The authors mention the Proprioceptive Theory and Fatigue Theory but only discuss their results at the hypothesis level without broader theoretical implications.	FALSE	NA
Study172	partial	adequate	The authors discuss the results in terms of their specific findings (e.g., changes in symmetry over time, differences between HP and LP players) but do not explicitly connect th...	FALSE	NA
Study173	partial	adequate	The authors mention the theories but primarily discuss the results in terms of specific hypotheses rather than broader theoretical implications.	FALSE	NA
Study174	partial	adequate	The authors discuss how their findings relate to previous theories on muscle fatigue and joint work redistribution but do not explicitly connect the results back to specific pre...	FALSE	NA
Study176	partial	adequate	The authors discuss how different Theraband positions affect muscle activation but do not explicitly connect these results back to a broader theoretical framework or specific pr...	FALSE	NA
Study177	partial	adequate	The authors mention Heat Acclimation but only discuss the results in terms of specific hypotheses (e.g., changes in TTymp, performance increases) rather than broader theoretical...	FALSE	NA
Study179	partial	adequate	The authors mention previous studies but do not explicitly connect their findings to a specific theoretical framework or broader claims.	FALSE	NA
Study180	partial	adequate	The authors mention the Stretch-Shortening Cycle (SSc) Theory but only discuss results at the hypothesis level, not considering broader theoretical implications.	FALSE	NA
Study181	partial	adequate	The authors discuss the results in terms of specific hypotheses but do not explicitly connect them to a broader theoretical framework.	FALSE	NA
Study182	partial	adequate	The authors mention previous offset loading literature and discuss how their findings contrast with these studies, but do not explicitly connect the results to a specific theore...	FALSE	NA
Study183	partial	adequate	The authors mention theories such as Delayed Onset Muscle Soreness (Doms) Theory, Eccentric Contraction Theory, Oxygen Availability Theory, Massage Therapy Theory, and Vibration...	FALSE	NA
Study184	partial	adequate	The authors mention the Mitochondrial Biogenesis Theory but only discuss results	FALSE	NA

			in terms of confirming or denying their specific hypothesis, without broader theoretical implica...		
Study185	partial	adequate	The authors discuss the relationship between hip ROM and pitching biomechanics but do not explicitly connect their findings back to the broader theoretical framework introduced ...	FALSE	NA
Study186	partial	adequate	The authors discuss their findings in terms of specific hypotheses (e.g., IRS improves recovery of power capacity), but do not fully interpret results through the broader theore...	FALSE	NA
Study187	partial	adequate	The authors mention the importance of sleep for athletes but do not explicitly connect the findings back to a specific theoretical framework or broader claims.	FALSE	NA
Study188	partial	adequate	The authors interpret results in terms of specific predictions from their hypothesis, but do not explicitly name or connect broader theoretical frameworks.	FALSE	NA
Study189	partial	adequate	The authors discuss how foam rolling (FR) affects muscle soreness, proprioception, and strength recovery but do not explicitly connect these results back to a broader theoretica...	FALSE	NA
Study190	partial	weak	The authors mention the Central Governor Model, Rating Of Perceived Exertion (Rpe), and Movement-Related Cortical Potential (Mrcp) but only discuss results at the hypothesis lev...	FALSE	NA
Study191	partial	adequate	The authors mention the importance of warm-up protocols on physical fitness qualities but do not explicitly connect results back to a broader theoretical framework or mechanism.	FALSE	NA
Study192	partial	adequate	The authors mention the National Sleep Foundation Recommendations but do not explicitly connect the results back to these broader theoretical claims or mechanisms.	FALSE	NA
Study193	partial	adequate	The authors mention the theory of nonlinear analyses but only discuss the results at a hypothesis level. They do not interpret the findings in terms of the broader theoretical f...	FALSE	NA
Study194	partial	adequate	The authors mention the Nitric Oxide Theory but only discuss results at the hypothesis level, not considering broader theoretical implications.	FALSE	NA
Study195	partial	adequate	The authors discuss how the results support their hypothesis about the small effect of WR on joint angles and angular velocities, but do not explicitly connect these findings to...	FALSE	NA

Study196	partial	adequate	The authors mention Self-Determination Theory and Central Governor Model but only discuss results in terms of specific hypotheses (e.g., physiological stress, limb discomfort) r...	FALSE	NA
Study197	partial	adequate	The authors mention Central Governor Model and Achievement Goal Theory but only discuss the results in terms of specific hypotheses rather than broader theoretical implications.	FALSE	NA
Study199	partial	adequate	The authors mention the Force-Velocity Profile but only discuss results in terms of hypothesis testing (e.g., significant differences between groups) without broader theoretical...	FALSE	NA
Study200	partial	adequate	The authors mention the Androgenic Effects On Muscle Function and Antioxidant Effects Of Eurycoma Longifolia Jack (Elj) theories but only discuss them in relation to specific hy...	FALSE	NA

6b: Null Result Handling

What this means. How authors respond to null or unexpected results is one of the most revealing indicators of theoretical rigour. **Accepted as disconfirming** is the scientifically strongest response — the authors acknowledge the failure and consider its implications for theory. **Auxiliary hypothesis** — invoking a new, untested moderator to explain the null away — is the Lakatosian *protective belt manoeuvre*: it preserves the theory at the cost of making it unfalsifiable. **Methodological artefact** attributes the null to design limitations without considering theoretical implications. **Not addressed** is the weakest response: null results are ignored. The distribution across these categories reveals whether the field treats disconfirmation as evidence or as noise to be explained away.

Null result handling — the epistemological quality of how authors respond to disconfirmatory evidence

Null result handling	Count	%	What this means
not_applicable	176	70%	Not applicable — all predictions were supported
not_addressed	61	24%	Null results present but not discussed by authors
accepted_as_disconfirming	13	5%	Authors treat the null as genuine evidence against the hypothesis/theory — scientifically strongest
methodological_artefact	2	1%	Null attributed to design limitations without theoretical consideration
auxiliary_hypothesis	1	0%	Null explained by a new assumption not in original rationale — Lakatosian protective belt

6c: Study Positioning

What this means. How each study positions its contribution relative to the existing theory-testing literature. **Novel prediction** studies test something genuinely new — progressive science in Lakatosian terms. **Replication** and **extension** studies confirm established findings. **Boundary test** studies examine conditions under which a theory holds or fails — theoretically valuable. **Unclear** studies do not specify their contribution relative to prior work.

Study positioning — how studies frame their contribution to the theory-testing literature

Study positioning	Count	%	What this means
extension	221	87%	Extending prior work to a new population, sport, or condition
replication	32	13%	Confirming an established finding in a new sample or context

6d: Theory Revision Signal

What this means. This is the most important dimension for assessing whether a study contributes to theoretical *progress* (Lakatos, 1978). A progressive study does not merely confirm or fail to confirm its hypothesis — it uses its findings to say something new about the theory. **None** is the baseline: the theoretical position after reading the discussion is identical to before. **Refined** means the authors specify conditions, boundary conditions, or mechanisms with greater precision. **Partially disconfirming** means the authors acknowledge their results are difficult to reconcile with the theory as stated.

New prediction generated is the hallmark of a progressive contribution: the authors use their findings to derive an untested prediction for future research. The distribution across these categories is the clearest indicator of whether a literature is advancing theoretically.

Theory revision signal — the extent to which discussions advance rather than merely confirm theoretical frameworks

Theory revision signal	Count	%	What this means
refined	28	11%	Findings used to specify conditions, boundary conditions, or mechanisms more precisely
partially_disconfirming	3	1%	Authors acknowledge results are difficult to reconcile with theory — revision may be required
none	222	88%	Theory treated as static backdrop — confirmation or failure without theoretical development

Articles with a theory revision signal — what specifically is proposed or changed

Article	Signal	What changes
Study077	partially_disconfirming	The authors suggest that the lack of short-term benefits may be due to differences in warm-up procedures and sample characteristics, indicating a need for further refinement of conditions under whi...
Study080	partially_disconfirming	The authors acknowledge that the lack of near- and far-transfer effects is difficult to reconcile with existing research, suggesting potential limitations in the specificity of the training task.
Study211	partially_disconfirming	The authors suggest that the relationship between enhanced expectancies of success and performance may be moderated by task complexity, characteristics of the learner, or an interplay between such ...
Study001	refined	The study provides more precise conditions under which SSG on larger areas may be beneficial for aerobic conditioning, clarifying the relationship between RPA and physiological responses.
Study015	refined	The authors suggest that the Caloric balance may be a misguided ideal for treatment, and propose focusing on nutrient balance (g/kg body mass) as it allows meeting metabolic needs at a lower total ...
Study019	refined	The authors specify conditions under which tendon adaptation occurs (higher experienced strain) and clarify the role of mechanical load in muscle adaptation.
Study025	refined	The authors refine the understanding of which types of proteins are more effective for increasing myofibrillar versus muscle connective protein synthesis rates, and under what conditions.
Study029	refined	The authors specify conditions under which the theory holds, such as the importance of normalizing exercise to critical intensity and considering sex differences in muscle properties.
Study058	refined	The authors specify conditions under which the GET and associated domain boundaries have a clear impact on neuromuscular function, providing more precise boundary conditions for when fatigability i...
Study073	refined	The authors suggest that the chunking hypothesis may explain analogy learning, refining the understanding of how analogies affect cognitive processes.
Study076	refined	The authors refine the theory by specifying conditions under which certain kinematic characteristics are associated with higher RF, such as a more negative touchdown distance and greater ankle dors...
Study083	refined	The authors suggest that the adaptation in GRF mechanics may be present during the late acceleration phase and propose future research to examine this, indicating a need for further refinement of t...
Study089	refined	The study provides more precise conditions under which step rate changes may reduce peak vGRF and CWPF, suggesting that the effect is more subtle than initially thought

		(e.g., requires individual-s...
Study096	refined	The authors suggest that the flywheel squat may be more effective for top-speed phases and highlight the need for specific criteria to increase inertia, indicating a refinement of the theory.
Study108	refined	The authors suggest that the non-significant result could indicate an absent effect of complexity but could also indicate low statistical power, refining our understanding of how to interpret such ...
Study115	refined	The authors refine the understanding that the frequency threshold for defining creative actions may vary based on interacting individual, task, and environment constraints.
Study127	refined	The authors refine the Static Stick Figure Model by specifying conditions under which it may be less applicable, such as when load placement and postural adjustments are significant factors.
Study133	refined	The authors refine the understanding that mental fatigue may not affect physiological factors like heart rate during endurance tests but can impact perception of effort and technical skills perform...
Study143	refined	The authors refine the understanding of muscle damage and recovery mechanisms by identifying specific changes in MuRF1 levels and their potential role in reduced explosive strength.
Study151	refined	The authors suggest that EB-RET may require manipulation to induce greater mechanical stress and robust iMyoPS stimulation in older adults, indicating a need for refining the optimal protocol.
Study174	refined	The authors suggest that fatigue may lead to a shift in muscle force production from hip extensors (hamstring muscles) to knee extensors (quadriceps muscles), which could serve as an injury minimiz...
Study178	refined	The authors specify conditions under which RST efficacy may be greater in resistance-trained climbers, suggesting that the RST input reaches its maximum during early contraction phases but may stil...
Study207	refined	The authors refine the understanding of how dispositional mindfulness interacts with PETTLEP imagery by specifying conditions under which high dispositional mindfulness performs better in retention.
Study213	refined	The authors suggest that CAI patients may have impaired sensory reweighting mechanisms, while copers can effectively reweight their remaining sensory information. This provides a more nuanced under...
Study221	refined	The authors specify conditions under which neural drive impairment occurs (repetitive explosive contractions) and provide a more precise understanding of its role in rapid force production.
Study236	refined	The authors refine the understanding of how midsole compliance and carbon-fiber plate properties interact to affect joint mechanics and metabolic rate.
Study246	refined	The authors refine the understanding that laboratory metrics expressed in absolute terms have the potential to discriminate between U23 ELITE and U23 NON-ELITE cyclists, while other metrics may not...
Study253	refined	The authors suggest that wrist guards may lead to increased torque/moment at the wrist, which could potentially increase injury risk over time. This implies a need to refine the conditions under wh...
Study261	refined	The authors refine the understanding of how work done by hip and knee moments during swing phase affects running performance, suggesting specific mechanisms (e.g., changes in muscle activation) tha...
Study265	refined	The authors clarify the conditions under which volume loads are effective, suggesting that extreme volume loads may be incompatible with strength and power training in-season.

Study266	refined	The authors suggest that experts use more optimal integration of prior information and visual kinematic information, refining the scope of Bayesian theory in this context.

Section 6e: Construct Validity — Methods Analysis

Methods. The methods section of each article was passed to the LLM alongside the theories and tested predictions identified in Pass 1. The model assessed whether the operational measures used in the study correspond to the theoretical constructs the theory specifies — the construct validity problem (Borsboom et al., 2004; Cronbach & Meehl, 1955). A study that cites Self-Determination Theory and states a hypothesis about need satisfaction, but then measures only performance outcomes, is not a genuine test of SDT regardless of its statistical results. This analysis reveals the extent to which the field's empirical methods are matched to its theoretical claims.

How to read this section. Aligned means the primary outcome measures directly operationalise the constructs the theory specifies. **Partial** means some measures correspond to theoretical constructs, others do not. **Misaligned** means the measures do not correspond to the theoretical constructs at all — the study cannot provide evidence for or against the theory it cites. **Mechanism operationalisation** assesses whether the study measures the intermediate constructs in the theory's causal chain, or only the endpoints.

Construct validity alignment — are the measures used appropriate for the theoretical constructs cited?

Metric	Count	%
Articles with methods sections analysed	256	100%
Construct validity: aligned — measures match theoretical constructs	17	7%
Construct validity: partial — some measures correspond, others do not	7	3%
Construct validity: misaligned — measures categorically different from constructs the theory specifies	2	1%
Construct validity: unclear — insufficient information or overly vague theory	212	83%
Construct validity: not applicable — no operational theory identified	18	7%
Extraction failures	4	2%

Mechanism operationalisation — does the study measure the causal pathway or only its endpoints?

Mechanism operationalisation	Count	%	What this means
not_applicable	33	57%	Theory type (taxonomic, paradigm) does not specify a measurable mechanism
endpoints_only	24	41%	Only the input and output are measured — the theoretical mechanism between them is not tested
mechanism_measured	1	2%	The study measures the intermediate construct(s) the theory specifies as the causal mechanism

Population boundary fit — whether the study sample matches the population for which the theory was developed

Population boundary fit	Count	%	What this means
within	49	67%	Sample is consistent with the population for which the theory was developed
unclear	24	33%	Insufficient information to assess population-theory boundary fit

Construct validity — article-level detail

Article	CV alignment	Mechanism	Population fit	Rationale
Study014	aligned	endpoints_only	within	The study measures lower-limb strength (force output) using horizontal leg press 1RM, KE MVIC, and proxies of muscle power (shot put distance and CMJ), which correspond to the c...

Study022	unclear	NA	NA	The methods section does not specify any theoretical constructs from the introduced theories (Overreaching Model, Central Governor Model, Self-Determination Theory). The study f...
Study023	unclear	NA	NA	The methods section does not specify any theoretical framework or constructs from Self-Determination Theory or any other theory. The study focuses on mechanical and metabolic re...
Study024	unclear	NA	NA	The methods section does not specify any theoretical constructs or a theoretical framework, making it unclear which constructs are being measured.
Study025	unclear	NA	NA	The methods section does not mention any theoretical constructs or a theoretical framework. There is no reference to Self-Determination Theory or any other theory that specifies...
Study026	unclear	NA	unclear	The study measures sensory reweighting outcomes such as gains, phases, COM residual power, COM 95% area, and sway velocity but does not mention any theoretical framework or cons...
Study027	unclear	NA	NA	The methods section does not specify any theoretical framework or constructs, such as EIMD theory or HSP theory. The measures include gastrointestinal temperature, thermal impul...
Study028	unclear	NA	NA	The methods section does not specify any theoretical framework or constructs from a theory. The study measures physiological and biochemical outcomes such as CK, LDH, AST, ALT, ...
Study029	unclear	NA	NA	The methods section does not specify any theoretical framework or constructs from a theory such as Critical Intensity or Sex Differences In Fatigability And Recovery. The measur...
Study030	unclear	not_applicable	within	The methods section focuses on performance outcomes such as time to complete and mean power during a 40 km TT, but does not mention any measures related to need satisfaction or ...
Study032	unclear	NA	NA	The introduction does not specify any operational theory or constructs, making it unclear which measures should be expected.
Study033	unclear	NA	NA	The methods section does not specify any theoretical framework or constructs from a theory such as Self-Determination Theory. The study focuses on cardiovascular health benefits...
Study034	unclear	NA	NA	The methods section primarily focuses on measuring quadriceps muscle function and endurance through various isometric and isokinetic assessments. There are no theoretical constr...
Study035	unclear	NA	NA	The methods section does not specify any theoretical constructs or a theoretical framework. The study focuses on comparing acute effects of traditional and alternated resistance...
Study036	unclear	NA	NA	The methods section does not specify a theoretical framework or constructs, making it unclear which measures correspond to any theoretical constructs.
Study037	unclear	not_applicable	within	The methods section does not specify any theoretical framework or constructs from Self-Determination Theory (SDT). The study focuses on cognitive performance, mood, and fatigue ...
Study038	unclear	not_applicable	within	The methods section describes the measurement of mechanical variables such as force, velocity, power, mean, peak, impulse, and rate of force development during concentric phases...

Study039	unclear	not_applicable	within	The methods section does not specify any theoretical framework or constructs from theories such as Self-Determination Theory, Achievement Goal Theory, or Central Governor Model....
Study040	unclear	NA	NA	The methods section does not specify any theoretical framework or constructs from a theory, making it unclear which measures correspond to any theoretical constructs.
Study041	unclear	NA	NA	The methods section does not specify any theoretical constructs or a theoretical framework, making it unclear which measures correspond to any potential underlying theory.
Study042	unclear	NA	NA	The methods section describes measures for foot muscle morphology, strength, cutaneous sensitivity, and balance control. However, the introduction does not specify any particula...
Study043	unclear	NA	NA	The methods section does not specify any theoretical framework or constructs from a theory, making it unclear which measures correspond to any theoretical constructs.
Study044	unclear	NA	NA	The methods section focuses on strength measurements and biomechanical analysis of pitching, but does not specify a primary theoretical framework or constructs. Without a clear ...
Study045	unclear	NA	NA	The methods section does not specify any theoretical constructs or a theoretical framework. The study focuses on improving neck strength through an intervention and measures out...
Study046	unclear	NA	NA	The methods section does not specify any theoretical framework or constructs from a theory, making it unclear which measures correspond to any theoretical constructs.
Study047	unclear	NA	NA	The methods section does not specify any theoretical constructs from a particular theory, such as Self-Determination Theory or Achievement Goal Theory. The measures include body...
Study050	unclear	NA	NA	The methods section does not specify any theoretical constructs or a theoretical framework, making it unclear which measures correspond to any theoretical constructs.
Study051	unclear	NA	NA	The methods section does not specify any theoretical constructs or a theoretical framework, making it unclear which measures correspond to any potential underlying theory.
Study052	unclear	NA	NA	The methods section focuses on measuring performance outcomes such as power output, cadence, and torque without mentioning any theoretical constructs or a specific theory.
Study053	unclear	NA	NA	The methods section does not specify any theoretical constructs or a theoretical framework. There is no clear indication of which constructs from Self-Determination Theory (SDT)...
Study054	unclear	NA	NA	The methods section does not specify any theoretical framework or constructs from a theory. There is no clear indication of which measures correspond to specific theoretical con...
Study055	unclear	NA	NA	The introduction does not specify any operational theory, and the methods section focuses on biomechanical and physiological measures such as stroke phase percentages, breathing...
Study057	unclear	NA	NA	The methods section does not specify any theoretical constructs or a theoretical framework. The study focuses on measuring physiological responses to exercise in hypoxic conditi...
Study058	unclear	not_applicable	unclear	The methods section does not specify any theoretical framework or constructs from which the primary hypotheses are derived, making it impossible to determine if the outcome meas...

Study059	unclear	not_applicable	unclear	The methods section primarily focuses on anthropometric indicators, bone metabolism indices, and BMD measurements. There is no clear reference to the theoretical constructs spec...
Study060	unclear	NA	NA	The methods section does not specify any theoretical constructs or a theoretical framework. There is no clear indication of which measures correspond to any theoretical constructs.
Study061	unclear	NA	NA	The methods section describes EMG data collection and analysis of scapular muscle activity ratios but does not specify a theoretical framework or constructs related to need sati...
Study065	unclear	NA	NA	The methods section does not specify any theoretical framework or constructs from a theory. There is no clear indication of which constructs were intended to be measured.
Study066	unclear	NA	NA	The methods section focuses on measuring physiological and performance outcomes such as running time trial performance, sweat loss, heart rate, and blood parameters. There is no...
Study067	unclear	endpoints_only	within	The methods section primarily focuses on measuring creatine kinase activity, biceps femoris stiffness, and sprint performance outcomes. There is no mention of the theoretical co...
Study068	unclear	NA	NA	The methods section does not specify any theoretical framework or constructs from a theory, making it unclear which measures correspond to any theoretical constructs.
Study069	unclear	NA	NA	The methods section does not specify any theoretical framework or constructs from theories like Stretch-Shortening Cycle, Flywheel Neuromuscular Training, or Machine-Based Neuro...
Study070	unclear	not_applicable	within	The methods section focuses on collecting kinematic and kinetic data during running, but does not mention any measures related to self-determination theory constructs such as ne...
Study072	unclear	NA	NA	The methods section does not specify any theoretical constructs from a particular theory, and the primary focus is on biomechanical and physiological responses to perturbations ...
Study073	unclear	NA	NA	The methods section does not specify any primary theoretical claim or constructs from a particular theory. The study focuses on basketball shooting technique and EEG activity, w...
Study074	unclear	NA	NA	The methods section focuses on measuring joint kinetics and muscle activity during bench press exercises with different types of plates, but does not mention any theoretical con...
Study075	unclear	NA	NA	The methods section does not specify a primary theoretical framework or constructs. The measures include attentional focus, affective valence, felt arousal, perceived exertion, ...
Study076	unclear	NA	NA	The methods section focuses on biomechanical measures such as ground reaction force, joint angles, and horizontal velocity, without mentioning any theoretical constructs or a sp...
Study077	unclear	NA	NA	The methods section focuses on the experimental protocol and statistical analysis but does not mention any theoretical constructs or a specific theory. There are no measures of ...
Study079	unclear	NA	NA	The methods section does not specify any theoretical constructs or a primary theory, making it unclear which constructs should be measured.
Study081	unclear	NA	NA	The methods section focuses on measuring passive MTPJ stiffness and various jump performance metrics such as CMJ tasks, but does not specify a primary theoretical framework or c...
Study082	unclear	NA	NA	The methods section does not specify any theoretical constructs or a

				theoretical framework, making it unclear which constructs should be measured.
Study083	unclear	not_applicable	unclear	The methods section focuses on measuring sprint performance, force platform data, and fatigue through the Yo-Yo IRl test. There is no clear reference to theoretical constructs s...
Study084	unclear	NA	NA	The methods section does not specify any theoretical framework or constructs from a theory, making it unclear which measures correspond to any theoretical constructs.
Study086	unclear	NA	NA	The methods section does not specify any theoretical constructs or a theoretical framework. The study focuses on performance outcomes such as VO2max, Yo-Yo IRT1, Yo-Yo IRT2, and...
Study087	unclear	NA	NA	The methods section does not specify any primary theoretical claim or operational theory, making it unclear which constructs should be measured.
Study088	unclear	not_applicable	within	The methods section focuses on biomechanical measurements such as ball velocity and joint kinematics but does not mention any theoretical constructs or frameworks like Self-Dete...
Study089	unclear	NA	NA	The methods section does not specify any theoretical framework or constructs from a theory such as Self-Determination Theory. The study focuses on measuring insole force, sacral...
Study092	unclear	NA	NA	The methods section primarily focuses on physiological measures such as NIRS and EMG signals, blood pressure (BP), and RPE. There is no clear reference to Self-Determination The...
Study093	unclear	NA	unclear	The methods section primarily focuses on the measurement of ankle proprioceptive sensitivity using an AMEDA device and stroking performance in table tennis players. There is no ...
Study095	unclear	NA	unclear	The study measures muscle soreness, MVCiso, MVCcon, NGF mRNA, GDNF mRNA, COX-2 mRNA, and NGF protein. However, the introduction does not specify any theoretical constructs or a ...
Study096	unclear	NA	NA	The methods section does not specify any theoretical constructs or reference a particular theory, making it unclear which constructs are being measured.
Study097	unclear	NA	NA	The study measures muscle stiffness (shear modulus) and range of motion, but does not specify a theoretical framework or constructs related to Self-Determination Theory or any o...
Study101	unclear	NA	NA	The introduction does not specify any operational theory, hence it is unclear which constructs are being measured.
Study102	unclear	not_applicable	unclear	The introduction did not specify any operational theory, hence there are no theoretical constructs to align with the measures. The methods section focuses on biomechanical varia...
Study103	unclear	NA	NA	The methods section does not specify any theoretical constructs or a theoretical framework, making it unclear which measures correspond to any potential underlying theory.
Study104	unclear	NA	NA	The methods section does not specify any theoretical constructs or a theory, making it unclear which measures correspond to any potential theoretical framework.
Study107	unclear	NA	NA	The introduction does not specify any theoretical constructs or operational theory, making it unclear what measures should be expected.
Study109	unclear	not_applicable	within	The methods section primarily focuses on kinematic data collection and retraining protocols for step rate but does not explicitly mention the constructs of Self-Determination Th...

Study110	unclear	NA	NA	The methods section primarily describes the measurement of MVIC, force steadiness and accuracy using a dynamometer. No theoretical constructs or specific theory are mentioned in...
Study111	unclear	NA	NA	The methods section does not specify any theoretical constructs or a theoretical framework. There is no mention of Self-Determination Theory or any other theory that would requi...
Study112	unclear	NA	NA	The methods section does not specify any theoretical framework or constructs related to Self-Determination Theory or need satisfaction. The study focuses on measuring muscle exc...
Study113	unclear	NA	NA	The methods section does not specify any theoretical constructs or a theoretical framework. The study focuses on measuring torque and neuromuscular responses following sustained...
Study114	unclear	NA	NA	The methods section does not specify any theoretical constructs or refer to any operational theory. The study focuses on measuring running performance metrics such as stride rat...
Study115	unclear	NA	NA	The study measures action types, functional actions, and creative actions but does not specify a primary theoretical framework or constructs in the introduction. The methods sec...
Study117	unclear	NA	NA	The methods section describes the measurement of RTs and HR in response to different warmup conditions but does not specify any theoretical constructs from a known theory such a...
Study118	unclear	NA	NA	The methods section does not specify any theoretical framework or constructs related to Self-Determination Theory or need satisfaction, making it unclear which measures correspo...
Study119	unclear	NA	NA	The methods section does not specify any theoretical constructs or a theoretical framework. The measures include anthropometric data, 1RM tests for C&J, squat, and bench press, ...
Study120	unclear	NA	NA	The methods section does not specify any theoretical constructs or a theoretical framework, making it unclear which measures correspond to any potential underlying theory.
Study121	unclear	NA	NA	The methods section does not specify any theoretical constructs or a theoretical framework, making it unclear which constructs should be measured.
Study123	unclear	NA	NA	The methods section focuses on MRI measurements of ACL CSA and patellar tendon diameter, as well as isometric and isokinetic strength testing. There are no theoretical construct...
Study125	unclear	NA	NA	The methods section does not specify any theoretical constructs or reference a particular theory. The measures include isometric midthigh pull (IMTP), standing long jump (SLJ), ...
Study126	unclear	NA	NA	The study measures kinematic and kinetic data such as pitch velocity, pelvis and trunk kinematics, and segment power analysis. However, there is no reference to Self-Determinati...
Study127	unclear	not_applicable	within	The methods section focuses on biomechanical and kinetic variables such as joint angles, peak net joint torques, and MEE. There is no mention of need satisfaction or any constru...
Study128	unclear	NA	NA	The methods section does not specify any theoretical constructs from Self-Determination Theory or any other theory. The study measures lumbopelvic control but does not provide a...
Study131	unclear	NA	within	The study measures pupil diameter, saccadic latency, average saccadic velocity, saccade accuracy, and total number of saccades, which are related to mental effort. However, the ...

Study134	unclear	NA	NA	The methods section focuses on measuring muscle characteristics such as cross-sectional area, thickness, and stiffness using ultrasound. There is no clear reference to any theor...
Study135	unclear	NA	NA	The methods section does not specify any theoretical constructs or a theoretical framework, making it unclear which measures correspond to any potential theoretical constructs.
Study136	unclear	NA	unclear	The methods section mentions measures such as SMR power, VAS for attention, control, and relaxation, FS, and credibility/expectancy. However, it is unclear which constructs from...
Study138	unclear	NA	NA	The methods section does not specify any theoretical constructs or a theoretical framework. The study measures jump and sprint performance but does not indicate that these outco...
Study139	unclear	NA	NA	The methods section focuses on measuring muscle architecture parameters such as fascicle length (L f), fascicle angle (FA), and muscle thickness (MT) during dynamic knee flexio...
Study143	unclear	NA	NA	The methods section does not specify any theoretical constructs or a theoretical framework, making it unclear which measures correspond to any theoretical constructs.
Study146	unclear	NA	NA	The methods section does not specify any theoretical constructs or a theoretical framework. There is no clear indication of which constructs are being measured, making it imposs...
Study148	unclear	not_applicable	unclear	The study measures performance outcomes such as torque and EMG activity but does not measure need satisfaction or any constructs from Self-Determination Theory (SDT). The primar...
Study149	unclear	NA	NA	The methods section does not specify any theoretical constructs or a theoretical framework. The measures include heart rate, power output, lactate levels, and gas exchange data ...
Study151	unclear	NA	NA	The methods section does not specify any theoretical constructs or a theoretical framework. The primary focus is on measuring physiological and biochemical markers such as muscl...
Study152	unclear	NA	within	The study measures quadriceps PT, CAR, RTD, blood lactate concentration, knee-extension repetitions, and quadriceps total work. However, the introduction does not specify any th...
Study153	unclear	NA	NA	The methods section describes the measurement of biomechanical parameters such as medial elbow torque, arm slot, arm speed, and shoulder rotation, but does not specify a theoret...
Study154	unclear	NA	NA	The methods section focuses on assessing sprint performance and related mechanical parameters but does not specify any theoretical constructs or a clear operational theory. The ...
Study155	unclear	NA	NA	The methods section does not specify any theoretical constructs or reference a particular theory. There are no measures of need satisfaction or other constructs from Self-Determ...
Study157	unclear	NA	NA	The introduction does not specify any operational theory or constructs, making it unclear which measures should be expected.
Study158	unclear	NA	NA	The methods section does not specify any theoretical framework or constructs from a theory such as Self-Determination Theory, Central Governor Model, or Fick Equation. The measu...
Study159	unclear	not_applicable	unclear	The methods section focuses on performance metrics such as distance covered, speed zones, and power events. There is no mention of need satisfaction or any constructs from Self-...
Study160	unclear	NA	NA	The methods section does not specify any theoretical constructs or a

				theoretical framework, making it unclear which measures correspond to any theoretical constructs.
Study161	unclear	NA	NA	The methods section does not specify any theoretical framework or constructs from which the primary hypotheses were derived. The measures include decision-making index, Stroop T...
Study162	unclear	NA	NA	The methods section does not specify any theoretical framework or constructs, making it unclear which measures correspond to any theoretical constructs.
Study165	unclear	NA	NA	The methods section does not specify any theoretical constructs or a theoretical framework. The study measures positional group-specific turning metrics but does not reference a...
Study166	unclear	NA	NA	The methods section does not specify any theoretical constructs or a theoretical framework. The study focuses on comparing the effects of two resistance priming sessions (BEP an...
Study168	unclear	NA	NA	The study measures performance outcomes such as MPV and strength testing but does not mention any constructs from the theories cited in the introduction, making it unclear which...
Study169	unclear	NA	unclear	The methods section does not specify a primary theoretical framework or constructs. The study measures various performance outcomes such as jump height, sprint velocity, COD abi...
Study170	unclear	not_applicable	within	The methods section focuses on performance outcomes such as sprint speed, CoD speed, muscle strength, and aerobic endurance. There is no mention of measuring need satisfaction o...
Study171	unclear	NA	NA	The methods section does not specify any primary theoretical claim or constructs from a particular theory, making it unclear which constructs should be measured.
Study172	unclear	NA	NA	The methods section does not specify any theoretical framework or constructs from a theory, making it unclear which measures correspond to any theoretical constructs.
Study174	unclear	NA	NA	The methods section does not specify any primary theoretical claim or construct from a theory such as Fatigue, Muscle Fatigue And Torque Degeneration, or Joint Work Redistributi...
Study176	unclear	NA	NA	The study measures muscle activation levels using EMG but does not specify any theoretical constructs from a known theory in the introduction. The methods section does not refer...
Study177	unclear	NA	NA	The methods section focuses on heat stress tests, physiological measures (tympanic temperature, heart rate, sweat loss), perceptual measures (RPE, thermal sensation, thermal com...
Study178	unclear	NA	NA	The introduction does not specify any primary theoretical constructs or claims, making it unclear what measures should be expected.
Study179	unclear	NA	NA	The methods section does not specify any theoretical constructs or a theoretical framework. The measures include physical demands variables such as total distance, sprints, and ...
Study181	unclear	NA	NA	The study measures muscle thickness and peak torque as outcomes but does not specify a theoretical framework or constructs in the introduction. The methods section focuses on ex...
Study183	unclear	NA	within	The methods section describes measures such as muscle oxygen saturation (SmO_2) and wrist-flexor strength, but it is unclear which theoretical constructs these measures correspon...
Study184	unclear	NA	NA	The introduction does not specify any operational theory, hence there are no theoretical constructs to align with the measures used in the study.

Study185	unclear	NA	NA	The methods section focuses on clinical and biomechanical analyses of hip AROM and pitching mechanics, without mentioning any theoretical constructs or a specific operational th...
Study186	unclear	NA	NA	The methods section does not specify any theoretical framework or constructs. There are no measures of need satisfaction or self-determination theory mechanisms.
Study187	unclear	NA	NA	The introduction does not specify any operational theory or constructs to align with the measures used in the study.
Study188	unclear	NA	NA	The methods section does not specify any theoretical constructs or a theoretical framework. The study focuses on measuring kinematic and EMG data during side-step cutting maneuv...
Study189	unclear	NA	NA	The methods section does not specify any theoretical framework or constructs from a theory. The measures include muscle soreness, pressure-pain threshold, joint position sense, ...
Study191	unclear	NA	NA	The introduction does not specify any operational theory or constructs. The methods section focuses on warm-up protocols and physical fitness tests (linear sprint, CODS, CMJ) wi...
Study192	unclear	not_applicable	within	The methods section mentions the assessment of chronotype, bedtime, wake-up time, night awakenings, and nap duration, which are related to sleep patterns but do not directly mea...
Study193	unclear	not_applicable	unclear	The methods section primarily focuses on quadriceps strength testing using isometric torque measures, which do not directly correspond to the constructs specified in the introdu...
Study194	unclear	not_applicable	within	The methods section focuses on measuring lower limb power output during half-squat exercise but does not mention any constructs from the Nitric Oxide Theory.
Study195	unclear	not_applicable	unclear	The methods section focuses on the kinematic data collected during sprint trials but does not mention any measures related to need satisfaction or self-determination theory cons...
Study196	unclear	NA	NA	The methods section does not specify any theoretical constructs from a particular theory, such as Self-Determination Theory, Central Governor Model, or Achievement Goal Theory. ...
Study197	unclear	NA	NA	The methods section does not specify any theoretical framework or constructs from a particular theory. The study focuses on the effects of L-menthol mouth swill on performance, ...
Study198	unclear	not_applicable	within	The methods section does not mention any theoretical constructs from Self-Determination Theory, Central Governor Model, or Achievement Goal Theory. The study focuses on the effe...
Study200	unclear	NA	NA	The methods section does not specify a primary theoretical framework or constructs. The measures include hormones, peak force, power, height in CMJ, reactive strength index in D...
Study201	unclear	NA	NA	The methods section does not specify any theoretical constructs or a theoretical framework. There is no clear indication of which theory the study is based on, and therefore it ...
Study203	unclear	NA	NA	The study measures muscular activation and metabolic responses but does not specify any theoretical constructs from a theory in the introduction. There is no clear alignment or ...
Study204	unclear	NA	NA	The methods section does not mention any theoretical constructs or a specific theory being applied. The study focuses on the effects of recovery time from a warm-up on vertical ...

Study205	unclear	NA	NA	The methods section focuses on biomechanical measurements such as joint angles, center of mass positions and velocities, kinetic energy of different body segments, and power-vel...
Study206	unclear	not_applicable	unclear	The methods section does not specify any theoretical framework or constructs from Self-Determination Theory or other relevant theories. The measures include CHS, CMJ, isometric ...
Study208	unclear	NA	NA	The introduction does not specify any operational theory or constructs. The methods section describes measures such as working memory assessment, fNIRS data acquisition, and EEG...
Study209	unclear	NA	NA	The methods section does not specify any theoretical constructs or a theoretical framework. There is no clear indication of which constructs are being measured in relation to th...
Study211	unclear	NA	unclear	The study measures performance variables such as absolute error, variable error, and the number of balls landing within the circle, but it does not specify any theoretical const...
Study212	unclear	not_applicable	unclear	The methods section primarily focuses on performance outcomes such as sprint time, CMJ height, peak power, take-off velocity, and push-off impulse. There is no mention of measur...
Study213	unclear	NA	NA	The methods section does not specify any theoretical constructs or a primary theory being tested, making it unclear which measures correspond to any theoretical framework.
Study214	unclear	NA	unclear	The methods section describes various physical fitness tests such as linear sprint speed, change of direction speed, countermovement jump, standing long-jump, and repeated sprin...
Study215	unclear	NA	NA	The methods section does not specify a primary theoretical framework or constructs. The measures include perceived enjoyment, technical-tactical performance, and psychophysiolog...
Study216	unclear	NA	NA	The methods section does not specify any theoretical constructs from a particular theory, such as Self-Determination Theory or Central Governor Model. The measures include isome...
Study217	unclear	not_applicable	within	The study measures rowing performance outcomes such as T250, T500, and T1000 times and average heart rate (HR), but there is no mention of Self-Determination Theory or any const...
Study218	unclear	NA	NA	The methods section does not specify any theoretical framework or constructs from a theory. The study focuses on kinematic and kinetic variables such as trunk and knee flexion a...
Study219	unclear	not_applicable	within	The methods section describes various physiological and biochemical measures such as blood lactate, growth hormone, creatine kinase levels, anaerobic energy expenditure, and vol...
Study220	unclear	NA	NA	The methods section does not specify any theoretical framework or constructs from a theory. The study focuses on evaluating the effect of shoe use on running economy and biomech...
Study221	unclear	NA	NA	The methods section does not specify any theoretical framework or constructs from a theory. There is no clear indication of which constructs are being measured.
Study222	unclear	NA	NA	The methods section does not specify any theoretical constructs or a theoretical framework. There is no mention of Self-Determination Theory or any other theory that would requi...
Study223	unclear	not_applicable	within	The methods section focuses on outcome measures such as sprint times, kinematics, and force-velocity profiles. There is no mention of need satisfaction or any constructs from Se...

Study227	unclear	not_applicable	within	The methods section focuses on performance outcomes such as sprint time, SLJ distance, and manoeuvrability test. There is no mention of measuring need satisfaction or any constr...
Study229	unclear	NA	NA	The study measures kinematic and kinetic parameters during jumping movements but does not specify any theoretical constructs or a theoretical framework in the introduction. The ...
Study232	unclear	NA	NA	The methods section does not specify any theoretical constructs from a particular theory, such as Postactivation Performance Enhancement (Pape), and instead focuses on performan...
Study233	unclear	NA	NA	The methods section focuses on assessing eccentric hamstrings strength, hamstrings stiffness, and landing biomechanics without explicitly referencing a theoretical framework or ...
Study234	unclear	NA	NA	The methods section focuses on ball speed and accuracy tests, but no theoretical constructs or framework are mentioned in the provided introduction.
Study235	unclear	NA	NA	The methods section does not specify any theoretical framework or constructs from a theory. The primary outcome measures are related to tendon elastic modulus, cross-sectional a...
Study236	unclear	NA	NA	The methods section describes the shoe conditions, experimental setup, data collection, and analysis procedures but does not specify a theoretical framework or constructs relate...
Study237	unclear	NA	NA	The methods section does not specify any theoretical constructs or a theoretical framework. The measures include kinematic and kinetic variables from side-cutting tests and isok...
Study238	unclear	NA	NA	The methods section describes various physiological measures such as MVC torque, sEMG, TMS-induced MEPs, SICI, and MMAX. However, there is no clear reference to a theoretical fr...
Study239	unclear	NA	NA	The methods section describes measures of climbing performance and perceived exertion but does not specify which theoretical constructs these measures correspond to. The introdu...
Study240	unclear	NA	NA	The study measures muscle thickness and strength outcomes but does not specify a theoretical framework or constructs related to Self-Determination Theory or any other theory inv...
Study242	unclear	NA	NA	The methods section does not specify any theoretical framework or constructs from a theory, making it unclear which measures correspond to any theoretical constructs.
Study243	unclear	NA	NA	The methods section does not specify any theoretical constructs or a theoretical framework such as Self-Determination Theory, and the primary outcome measures are biomechanical ...
Study244	unclear	NA	NA	The study measures performance outcomes such as strength and power tests, RPE, session-RPE, hunger, satiety, glycaemia, and lactate concentration. However, the introduction does...
Study245	unclear	NA	NA	The methods section does not specify any theoretical framework or constructs from which to derive alignment. The study focuses on measuring neuromuscular control through EMG and...
Study246	unclear	NA	NA	The methods section does not specify any theoretical framework or constructs, making it unclear which measures correspond to any theoretical constructs.
Study247	unclear	NA	NA	The methods section focuses on physiological measures such as heart rate, ventilatory data, EMG di, and respiratory pressures but does not specify a theoretical framework or con...

Study248	unclear	NA	NA	The methods section does not specify any theoretical constructs or a theoretical framework such as Self-Determination Theory. The study focuses on Repeated High-Intensity Effort...
Study249	unclear	not_applicable	within	The methods section focuses on measuring flexibility and muscle strength outcomes through ROM, passive torque, MTU stiffness, and muscle strength measurements. There is no menti...
Study251	unclear	NA	NA	The methods section describes various biomechanical and performance measures, but it is unclear which theoretical constructs from the introduction are being addressed. The prima...
Study252	unclear	NA	NA	The methods section describes measures of muscle activity (UT, MT, and LT) during exercises but does not specify any theoretical constructs from a particular theory in the intro...
Study254	unclear	NA	NA	The methods section focuses on measuring kinematic and kinetic variables during squatting at different depths with varying loads. There is no mention of constructs from any theo...
Study255	unclear	NA	within	The methods section describes measures of tissue hardness, pain pressure threshold (PPT), knee flexion ROM, and CMJ, but does not specify a theoretical framework or constructs t...
Study256	unclear	NA	NA	The methods section does not specify any theoretical constructs from a named theory. The study focuses on the effects of load and attentional focus on mechanical parameters duri...
Study257	unclear	NA	NA	The methods section does not specify any theoretical framework or constructs from a theory, making it unclear which measures correspond to any theoretical constructs.
Study258	unclear	NA	NA	The methods section describes various physiological and subjective measures, but does not specify a primary theoretical framework or constructs. The measures include sleep param...
Study259	unclear	not_applicable	unclear	The study measures functional balance, rectal temperature, and RPE but does not specify which theoretical constructs these measures correspond to in the introduction. The theori...
Study260	unclear	NA	within	The methods section mentions several outcome measures such as motor reaction time, processing time, and cognitive performance tasks but does not clearly specify which theoretica...
Study261	unclear	NA	within	The methods section focuses on measuring spatiotemporal parameters and mechanical work estimations during running tasks. There is no clear reference to the theoretical construct...
Study262	unclear	not_applicable	unclear	The methods section describes biomechanical analysis of single-leg drop vertical jump (DVJ) performance but does not mention any theoretical constructs or need satisfaction mech...
Study263	unclear	NA	NA	The methods section does not mention any theoretical constructs or a specific theory that the study is based on. The measures include CMJ, sprint performance, and warm-up protoc...
Study264	unclear	NA	NA	The methods section focuses on the kinematic and kinetic analysis of pitching mechanics but does not mention any theoretical constructs or a specific theory. There is no clear i...
Study265	unclear	NA	NA	The methods section does not specify any theoretical framework or constructs from a theory. There is no clear indication of which constructs are being measured.
Study266	unclear	NA	NA	The methods section does not specify any theoretical framework or constructs from a theory such as Bayesian Statistics, Motor Simulation Theory, Action Anticipation Theory, or E...

Study267	unclear	NA	NA	The study measures outcome errors, control errors, and number call errors but does not specify any theoretical constructs from a known operational theory in the introduction. Th...
Study268	unclear	NA	unclear	The study measures physical activity, motivation, pain intensity, and pain unpleasantness but does not specify a theoretical framework or constructs from which these measures ar...
Study269	unclear	NA	NA	The methods section does not specify any theoretical framework or constructs from a particular theory. The study focuses on performance outcomes such as repeated-sprint ability ...
Study270	unclear	not_applicable	unclear	The methods section mentions measuring maximum muscle strength (1-RM BP and 1-RM LE), technique (velocity, stroke rate, stroke length and stroke index) and swimming performance ...
Study271	unclear	NA	NA	The methods section mentions measures such as aerobic fitness (YY-IRTL-1), physical fatigue (RSME), mood (BRUMS, PACES), and technical performance. However, there is no clear re...
Study272	unclear	NA	NA	The study measures neurocognitive assessments and dynamic postural stability but does not specify a primary theoretical framework or constructs. Without a clear theory, it is un...

Section 7: Full Theory Chain

Methods. This section synthesises results from the three preceding analyses into a single article-level summary. For each article, it shows whether a theory was identified, whether hypotheses were theoretically grounded, and whether the discussion re-engaged with the theory. Together, these constitute the full scientific reasoning chain: Theory → Hypothesis → Test → Interpretation.

How to read this section. Articles showing a complete and coherent chain (strong theoretical basis, strong hypothesis alignment, full discussion re-engagement, no overclaiming) demonstrate best-practice theoretical reasoning. Articles with gaps at any stage represent specific types of theoretical weakness.

Full theory chain per article: Introduction → Hypothesis → Discussion

Article	Theories (n)	Theories cited	Hypothesis alignment	Discussion quality	Re-engagement	Overclaim

Section 7b: Theory Quality Index

What this means. The Theory Quality Index (TQI) is a composite score combining six dimensions of theory use quality at the article level. It provides a single summary measure of how rigorously theory was used in each study, suitable for distributional analysis and for identifying studies at different quality levels. Each dimension is scored 0–1 and averaged.

Dimension	1 point	0 points
Theory present	≥1 theory identified	No theory
Operational	≥1 theory operational	All theories contextual
Hypothesis grounded	Alignment = strong	Partial or absent
Discussion re-engaged	Re-engagement = full	Partial or absent
No overclaiming	No overclaims detected	Overclaiming detected
Construct validity	Methods aligned to theory	Partial, misaligned, or unclear

How to read this section. A TQI of 1.0 (6/6) indicates a study that named a theory, used it to generate a prediction, grounded its hypotheses in that theory, operationalised the correct constructs in its methods, returned to the theory in the discussion, and made no unsupported claims. A TQI of 0.0 indicates failure at all criteria. The distribution across the sample reveals the overall state of theoretical rigour in the literature.

Theory Quality Index distribution — proportion of articles meeting each quality threshold

TQI band	Count	%
Very low (0–2/6 criteria met)	229	85%
Moderate (4/6 criteria met)	3	1%
Low (3/6 criteria met)	37	14%

Theory Quality Index per article — 1 = criterion met, 0 = criterion not met, NA = data unavailable

Section 8: Keyword-in-Context — “theory”

Methods. As an independent validity check on the LLM extraction, a direct lexical search was conducted across all introduction texts for the word *theory* (case-insensitive). For each occurrence, the ten words immediately before and after are shown. This allows readers to verify that the LLM-extracted theories correspond to genuine theoretical language in the text, and to identify cases where the word “theory” appears in contexts that do not represent genuine theoretical frameworks (e.g., “no theoretical basis exists for…”).

How to read this section. Each row is one occurrence of the word “theory” in one article’s introduction. The article identifier is shown in the left column, the word “theory” (highlighted in red) is in the centre, and the surrounding words provide context. Compare these entries against the theories extracted in Section 3 to assess the model’s accuracy.

All occurrences of 'theory' in article introductions (±10 words). Total: 19 occurrences across 13 articles.

Section 9: Theory Database

Methods. As theories were extracted from the sample, they were matched against a curated database of established theoretical frameworks. The database stores a canonical name, known aliases, domain, original authors, year proposed, a formal definition, the boundaries of the theory (what it covers and what it does not), and an example of how it is used in sports science research. New theories not yet in the database are added as stubs and flagged for manual completion. This database is designed to grow over time and may eventually serve as a reference tool for researchers selecting theoretical frameworks for new studies.

How to read this section. Each row is one theoretical framework. The Definition column states what the theory proposes. The Boundaries column is particularly important — it clarifies what the theory can and cannot explain, which is relevant for assessing whether it has been applied appropriately in the articles reviewed. Entries marked STUB have been identified in the sample but not yet formally defined.
